(54) Title: CARBOXYAMIDE COMPOUNDS, COMPOSITIONS, AND METHODS FOR INHIBITING PARP ACTIVITY

(57) Abstract

A compound of formula (I) or a pharmaceutically acceptable salt, hydrate, ester, solvate, prodrug, metabolite, stereoisomer, or mixtures thereof; wherein: Y represents the atoms necessary to form a fused 5-to 6-membered, aromatic or non-aromatic, carbocyclic or N-containing heterocyclic ring, wherein Y and any heteroatom(s) therein are unsubstituted or independently substituted by at least one non-interfering alkyl, alkenyl, cycloalkyl, cycloalkenyl, aralkyl, aryl, carboxy or halo substituent; X is at the 1-position of ring Y and is -COOR₅ or a substituted or unsubstituted moiety selected from the group consisting of (a), (b), (c), (d), (e), (f) and (g) wherein R₇ is hydrogen, alkyl, alkenyl, cycloalkyl or cycloalkenyl, and is itself either unsubstituted or substituted with an alkyl, alkenyl, cycloalkyl or cycloalkenyl group; R₁ is hydrogen, alkyl, alkenyl, cycloalkyl or cycloalkenyl, and is itself either unsubstituted or substituted with an alkyl, alkenyl, cycloalkyl or cycloalkenyl group; R₂, R₃, R₄ and R₅ are independently hydrogen, alkyl, alkenyl, cycloalkyl, cycloalkenyl, aralkyl, or aryl, and are either unsubstituted or substituted with a moiety selected from the group consisting of alkyl, alkenyl, alkoxy, phenoxy, benzyloxy, cycloalkyl, cycloalkenyl, hydroxy, carboxy, carbonyl, amino, amido, cyano, isocyano, nitro, nitroso, nitrilo, isonitrilo, imino, azo, diazo, sulfonyl, sulfoxy, thio, thiocarbonyl, sulfhydryl, halo, haloalkyl, trifluoromethyl and aryl.

**CARBOXYAMIDE COMPOUNDS, COMPOSITIONS, AND METHODS
FOR INHIBITING PARP ACTIVITY**

BACKGROUND OF THE INVENTION

5 1. Field of the Invention

The present invention relates to inhibitors of the nucleic enzyme poly(adenosine 5'-diphospho-ribose) polymerase ["poly(ADP-ribose) polymerase" or "PARP", which is also sometimes called "PARS" for poly(ADP-ribose) synthetase].
10 More particularly, the invention relates to the use of PARP inhibitors to prevent and/or treat tissue damage resulting from cell damage or death due to necrosis or apoptosis; neural tissue damage resulting from ischemia and reperfusion injury; neurological disorders and neurodegenerative
15 diseases; to prevent or treat vascular stroke; to treat or prevent cardiovascular disorders; to treat other conditions and/or disorders such as age-related macular degeneration, AIDS and other immune senescence diseases, arthritis, atherosclerosis, cachexia, cancer, degenerative diseases of
20 skeletal muscle involving replicative senescence, diabetes, head trauma, immune senescence, inflammatory bowel disorders (such as colitis and Crohn's disease), muscular dystrophy, osteoarthritis, osteoporosis, chronic and acute pain (such as neuropathic pain), renal failure, retinal ischemia, septic
25 shock (such as endotoxic shock), and skin aging; to extend the lifespan and proliferative capacity of cells; to alter gene expression of senescent cells; or to radiosensitize hypoxic tumor cells.

30 2. Description of the Prior Art

Poly(ADP-ribose) polymerase ("PARP") is an enzyme located in the nuclei of cells of various organs, including muscle, heart and brain cells. PARP plays a physiological role in the repair of strand breaks in DNA. Once activated
35 by damaged DNA fragments, PARP catalyzes the attachment of up to 100 ADP-ribose units to a variety of nuclear proteins,

including histones and PARP itself. While the exact range of functions of PARP has not been fully established, this enzyme is thought to play a role in enhancing DNA repair.

During major cellular stresses, however, the extensive 5 activation of PARP can rapidly lead to cell damage or death through depletion of energy stores. Four molecules of ATP are consumed for every molecule of NAD (the source of ADP-ribose) regenerated. Thus, NAD, the substrate of PARP, is depleted by massive PARP activation and, in the efforts to 10 re-synthesize NAD, ATP may also be depleted.

It has been reported that PARP activation plays a key role in both NMDA- and NO-induced neurotoxicity, as shown by the use of PARP inhibitors to prevent such toxicity in cortical cultures in proportion to their potencies as 15 inhibitors of this enzyme (Zhang et al., "Nitric Oxide Activation of Poly(ADP-Ribose) Synthetase in Neurotoxicity", **Science**, 263:687-89 (1994)); and in hippocampal slices (Wallis et al., "Neuroprotection Against Nitric Oxide Injury with Inhibitors of ADP-Ribosylation", **NeuroReport**, 5:3, 245-20 48 (1993)). The potential role of PARP inhibitors in treating neurodegenerative diseases and head trauma has thus been known. Research, however, continues to pinpoint the exact mechanisms of their salutary effect in cerebral ischemia, (Endres et al., "Ischemic Brain Injury is Mediated 25 by the Activation of Poly(ADP-Ribose) Polymerase", **J. Cereb. Blood Flow Metabol.**, 17:1143-51 (1997)) and in traumatic brain injury (Wallis et al., "Traumatic Neuroprotection with Inhibitors of Nitric Oxide and ADP-Ribosylation", **Brain Res.**, 710:169-77 (1996)).

30 It has been demonstrated that single injections of PARP inhibitors have reduced the infarct size caused by ischemia and reperfusion of the heart or skeletal muscle in rabbits. In these studies, a single injection of the PARP inhibitor, 3-amino-benzamide (10 mg/kg), either one minute before 35 occlusion or one minute before reperfusion, caused similar reductions in infarct size in the heart (32-42%). Another

PARP inhibitor, 1,5-dihydroxyisoquinoline (1 mg/kg), reduced infarct size by a comparable degree (38-48%). Thiemermann et al., "Inhibition of the Activity of Poly(ADP Ribose) Synthetase Reduces Ischemia-Reperfusion Injury in the Heart and Skeletal Muscle", *Proc. Natl. Acad. Sci. USA*, **94**:679-83 (1997). This finding has suggested that PARP inhibitors might be able to salvage previously ischemic heart or skeletal muscle tissue.

PARP activation has also been shown to provide an index of damage following neurotoxic insults by glutamate (via NMDA receptor stimulation), reactive oxygen intermediates, amyloid β -protein, n-methyl-4-phenyl-1,2,3,6-tetrahydropyridine (MPTP) and its active metabolite N-methyl-4-phenylpyridine (MPP $^{+}$), which participate in pathological conditions such as stroke, Alzheimer's disease and Parkinson's disease. Zhang et al., "Poly(ADP-Ribose) Synthetase Activation: An Early Indicator of Neurotoxic DNA Damage", *J. Neurochem.*, **65**:3, 1411-14 (1995). Other studies have continued to explore the role of PARP activation in cerebellar granule cells in vitro and in MPTP neurotoxicity. Cosi et al., "Poly(ADP-Ribose) Polymerase (PARP) Revisited. A New Role for an Old Enzyme: PARP Involvement in Neurodegeneration and PARP Inhibitors as Possible Neuroprotective Agents", *Ann. N. Y. Acad. Sci.*, 825:366-79 (1997); and Cosi et al., "Poly(ADP-Ribose) Polymerase Inhibitors Protect Against MPTP-induced Depletions of Striatal Dopamine and Cortical Noradrenaline in C57B1/6 Mice", *Brain Res.*, **729**:264-69 (1996).

Neural damage following stroke and other neurodegenerative processes is thought to result from a massive release of the excitatory neurotransmitter glutamate, which acts upon the N-methyl-D-aspartate (NMDA) receptors and other subtype receptors. Glutamate serves as the predominate excitatory neurotransmitter in the central nervous system (CNS). Neurons release glutamate in great quantities when they are deprived of oxygen, as may occur during an ischemic brain insult such as a stroke or heart

attack. This excess release of glutamate in turn causes over-stimulation (excitotoxicity) of N-methyl-D-aspartate (NMDA), AMPA, Kainate and MGR receptors. When glutamate binds to these receptors, ion channels in the receptors open, 5 permitting flows of ions across their cell membranes, e.g., Ca^{2+} and Na^+ into the cells and K^+ out of the cells. These flows of ions, especially the influx of Ca^{2+} , cause overstimulation of the neurons. The over-stimulated neurons secrete more glutamate, creating a feedback loop or domino 10 effect which ultimately results in cell damage or death via the production of proteases, lipases and free radicals. Excessive activation of glutamate receptors has been implicated in various neurological diseases and conditions including epilepsy, stroke, Alzheimer's disease, Parkinson's 15 disease, Amyotrophic Lateral Sclerosis (ALS), Huntington's disease, schizophrenia, chronic pain, ischemia and neuronal loss following hypoxia, hypoglycemia, ischemia, trauma, and nervous insult. Recent studies have also advanced a glutamatergic basis for compulsive disorders, particularly 20 drug dependence. Evidence includes findings in many animal species, as well as, in cerebral cortical cultures treated with glutamate or NMDA, that glutamate receptor antagonists block neural damage following vascular stroke. Dawson et al., "Protection of the Brain from Ischemia", *Cerebrovascular 25 Disease*, 319-25 (H. Hunt Batjer ed., 1997). Attempts to prevent excitotoxicity by blocking NMDA, AMPA, Kainate and MGR receptors have proven difficult because each receptor has multiple sites to which glutamate may bind. Many of the compositions that are effective in blocking the receptors 30 are also toxic to animals. As such, there is no known effective treatment for glutamate abnormalities.

The stimulation of NMDA receptors, in turn, activates the enzyme neuronal nitric oxide synthase (NNOS), which causes the formation of nitric oxide (NO), which more 35 directly mediates neurotoxicity. Protection against NMDA neurotoxicity has occurred following treatment with NOS

inhibitors. See Dawson et al., "Nitric Oxide Mediates Glutamate Neurotoxicity in Primary Cortical Cultures", *Proc. Natl. Acad. Sci. USA*, **88**:6368-71 (1991); and Dawson et al., "Mechanisms of Nitric Oxide-mediated Neurotoxicity in Primary Brain Cultures", *J. Neurosci.*, **13**:6, 2651-61 (1993). Protection against NMDA neurotoxicity can also occur in cortical cultures from mice with targeted disruption of NNOS. See Dawson et al., "Resistance to Neurotoxicity in Cortical Cultures from Neuronal Nitric Oxide Synthase-Deficient Mice", *J. Neurosci.*, **16**:8, 2479-87 (1996).

It is known that neural damage following vascular stroke is markedly diminished in animals treated with NOS inhibitors or in mice with NNOS gene disruption. Iadecola, "Bright and Dark Sides of Nitric Oxide in Ischemic Brain Injury", *Trends Neurosci.*, **20**:3, 132-39 (1997); and Huang et al., "Effects of Cerebral Ischemia in Mice Deficient in Neuronal Nitric Oxide Synthase", *Science*, **265**:1883-85 (1994). See also, Beckman et al., "Pathological Implications of Nitric Oxide, Superoxide and Peroxynitrite Formation", *Biochem. Soc. Trans.*, **21**:330-34 (1993). Either NO or peroxynitrite can cause DNA damage, which activates PARP. Further support for this is provided in Szabó et al., "DNA Strand Breakage, Activation of Poly(ADP-Ribose) Synthetase, and Cellular Energy Depletion are Involved in the Cytotoxicity in Macrophages and Smooth Muscle Cells Exposed to Peroxynitrite", *Proc. Natl. Acad. Sci. USA*, **93**:1753-58 (1996).

Zhang et al., U.S. Patent No. 5,587,384 issued December 24, 1996, discusses the use of certain PARP inhibitors, such as benzamide and 1,5-dihydroxy-isoquinoline, to prevent NMDA-mediated neurotoxicity and, thus, treat stroke, Alzheimer's disease, Parkinson's disease and Huntington's disease. However, it is has now been discovered that Zhang et al. may have been in error in classifying neurotoxicity as NMDA-mediated neurotoxicity. Rather, it may have been more appropriate to classify the *in vivo* neurotoxicity present as

glutamate neurotoxicity. See Zhang et al. "Nitric Oxide Activation of Poly(ADP-Ribose) Synthetase in Neurotoxicity", *Science*, 263:687-89 (1994). See also, Cosi et al., Poly(ADP-Ribose) Polymerase Inhibitors Protect Against MPTP-induced Depletions of Striatal Dopamine and Cortical Noradrenaline in C57Bl/6 Mice", *Brain Res.*, 729:264-69 (1996).

It is also known that PARP inhibitors affect DNA repair generally. Cristovao et al., "Effect of a Poly(ADP-Ribose) Polymerase Inhibitor on DNA Breakage and Cytotoxicity Induced by Hydrogen Peroxide and γ -Radiation," *Terato., Carcino., and Mutagen.*, 16:219-27 (1996), discusses the effect of hydrogen peroxide and γ -radiation on DNA strand breaks in the presence of and in the absence of 3-aminobenzamide, a potent inhibitor of PARP. Cristovao et al. observed a PARP-dependent recovery of DNA strand breaks in leukocytes treated with hydrogen peroxide.

PARP inhibitors have been reported to be effective in radiosensitizing hypoxic tumor cells and effective in preventing tumor cells from recovering from potentially lethal damage of DNA after radiation therapy, presumably by their ability to prevent DNA repair. See U.S. Patent Nos. 5,032,617; 5,215,738; and 5,041,653.

Evidence also exists that PARP inhibitors are useful for treating inflammatory bowel disorders. Salzman et al., "Role of Peroxynitrite and Poly(ADP-Ribose) Synthase Activation in Experimental Colitis," *Japanese J. Pharm.*, 75, Supp. I:15 (1997), discusses the ability of PARP inhibitors to prevent or treat colitis. Colitis was induced in rats by intraluminal administration of the hapten trinitrobenzene sulfonic acid in 50% ethanol. Treated rats received 3-aminobenzamide, a specific inhibitor of PARP activity. Inhibition of PARP activity reduced the inflammatory response and restored the morphology and the energetic status of the distal colon. See also, Southan et al., "Spontaneous Rearrangement of Aminoalkylthioureas into Mercaptoalkylguanidines, a Novel Class of Nitric Oxide

Synthase Inhibitors with Selectivity Towards the Inducible Isoform", *Br. J. Pharm.*, 117:619-32 (1996); and Szabó et al., "Mercaptoethylguanidine and Guanidine Inhibitors of Nitric Oxide Synthase React with Peroxynitrite and Protect Against 5 Peroxynitrite-induced Oxidative Damage", *J. Biol. Chem.*, 272:9030-36 (1997).

Evidence also exists that PARP inhibitors are useful for treating arthritis. Szabó et al., "Protective Effects of an Inhibitor of Poly(ADP-Ribose)Synthetase in Collagen-Induced 10 Arthritis," *Japanese J. Pharm.*, 75, Supp. I:102 (1997), discusses the ability of PARP inhibitors to prevent or treat collagen-induced arthritis. See also Szabó et al., "DNA Strand Breakage, Activation of Poly(ADP-Ribose)Synthetase, and Cellular Energy Depletion are Involved in the 15 Cytotoxicity in Macrophages and Smooth Muscle Cells Exposed to Peroxynitrite," *Proc. Natl. Acad. Sci. USA*, 93:1753-58 (March 1996); Bauer et al., "Modification of Growth Related Enzymatic Pathways and Apparent Loss of Tumorigenicity of a ras-transformed Bovine Endothelial Cell Line by Treatment 20 with 5-Iodo-6-amino-1,2-benzopyrone (INH₂BP)", *Intl. J. Oncol.*, 8:239-52 (1996); and Hughes et al., "Induction of T Helper Cell Hyporesponsiveness in an Experimental Model of Autcimmunity by Using Nonmitogenic Anti-CD3 Monoclonal Antibody", *J. Immuno.*, 153:3319-25 (1994).

25 Further, PARP inhibitors appear to be useful for treating diabetes. Heller et al., "Inactivation of the Poly(ADP-Ribose)Polymerase Gene Affects Oxygen Radical and Nitric Oxide Toxicity in Islet Cells," *J. Biol. Chem.*, 270:19, 11176-80 (May 1995), discusses the tendency of PARP 30 to deplete cellular NAD⁺ and induce the death of insulin-producing islet cells. Heller et al. used cells from mice with inactivated PARP genes and found that these mutant cells did not show NAD⁺ depletion after exposure to DNA-damaging radicals. The mutant cells were also found to be more 35 resistant to the toxicity of NO.

Further still, PARP inhibitors have been shown to be useful for treating endotoxic shock or septic shock. Zingarelli et al., "Protective Effects of Nicotinamide Against Nitric Oxide-Mediated Delayed Vascular Failure in Endotoxic Shock: Potential Involvement of PolyADP Ribosyl Synthetase," **Shock**, 5:258-64 (1996), suggests that inhibition of the DNA repair cycle triggered by poly(ADP ribose) synthetase has protective effects against vascular failure in endotoxic shock. Zingarelli et al. found that nicotinamide protects against delayed, NO-mediated vascular failure in endotoxic shock. Zingarelli et al. also found that the actions of nicotinamide may be related to inhibition of the NO-mediated activation of the energy-consuming DNA repair cycle, triggered by poly(ADP ribose) synthetase. See also, Cuzzocrea, "Role of Peroxynitrite and Activation of Poly(ADP-Ribose) Synthetase in the Vascular Failure Induced by Zymosan-activated Plasma," **Brit. J. Pharm.**, 122:493-503 (1997).

Yet another known use for PARP inhibitors is treating cancer. Suto et al., "Dihydroisoquinolinones: The Design and Synthesis of a New Series of Potent Inhibitors of Poly(ADP-Ribose) Polymerase", **Anticancer Drug Des.**, 7:107-17 (1991), discloses processes for synthesizing a number of different PARP inhibitors. In addition, Suto et al., U.S. Patent No. 5,177,075, discusses several isoquinolines used for enhancing the lethal effects of ionizing radiation or chemotherapeutic agents on tumor cells. Weltin et al., "Effect of 6(5H)-Phenanthridinone, an Inhibitor of Poly(ADP-ribose) Polymerase, on Cultured Tumor Cells", **Oncol. Res.**, 6:9, 399-403 (1994), discusses the inhibition of PARP activity, reduced proliferation of tumor cells, and a marked synergistic effect when tumor cells are co-treated with an alkylating drug.

Still another use for PARP inhibitors is the treatment of peripheral nerve injuries, and the resultant pathological pain syndrome known as neuropathic pain, such as that induced

by chronic constriction injury (CCI) of the common sciatic nerve and in which transsynaptic alteration of spinal cord dorsal horn characterized by hyperchromatosis of cytoplasm and nucleoplasm (so-called "dark" neurons) occurs. See Mao et al., *Pain*, 72:355-366 (1997).

PARP inhibitors have also been used to extend the lifespan and proliferative capacity of cells including treatment of diseases such as skin aging, Alzheimer's disease, atherosclerosis, osteoarthritis, osteoporosis, muscular dystrophy, degenerative diseases of skeletal muscle involving replicative senescence, age-related macular degeneration, immune senescence, AIDS, and other immune senescence diseases; and to alter gene expression of senescent cells. See WO 98/27975.

Large numbers of known PARP inhibitors have been described in Banasik et al., "Specific Inhibitors of Poly(ADP-Ribose) Synthetase and Mono(ADP-Ribosyl)-Transferase", *J. Biol. Chem.*, 267:3, 1569-75 (1992), and in Banasik et al., "Inhibitors and Activators of ADP-Ribosylation Reactions", *Molec. Cell. Biochem.*, 138:185-97 (1994).

However, the approach of using these PARP inhibitors in the ways discussed above has been limited in effect. For example, side effects have been observed with some of the best-known PARP inhibitors, as discussed in Milam et al., "Inhibitors of Poly(Adenosine Diphosphate-Ribose) Synthesis: Effect on Other Metabolic Processes", *Science*, 223:589-91 (1984). Specifically, the PARP inhibitors 3-aminobenzamide and benzamide not only inhibited the action of PARP but also were shown to affect cell viability, glucose metabolism, and DNA synthesis. Thus, it was concluded that the usefulness of these PARP inhibitors may be severely restricted by the difficulty of finding a dose that will inhibit the enzyme without producing additional metabolic effects.

Huff et al. discloses a process for the stereo-controlled synthesis of cis-decahydroisoquinoline-3-

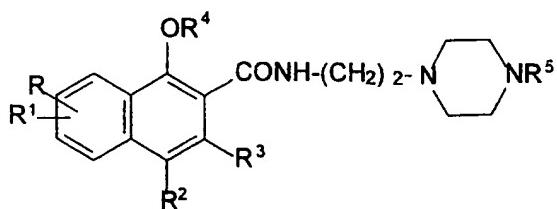

carboxylic acids. Huff et al., U.S. Patent No. 5,338,851, issued August 16, 1994. The compounds in Huff et al. are taught to be useful in the synthesis of NMDA excitatory amino acid receptor antagonists, which can have a neuroprotective effect.

Ornstein discloses decahydroisoquinoline-3-carboxylic acids as antagonists of NMDA amino acid receptors. Ornstein, "Excitatory Amino Acid Receptor Antagonists", U.S. Patent No. 4,902,695, issued February 20, 1990. Examples include 10 decahydro-6-[1(2)H-tetrazol-5-ylmethyl]-3-isoquinolinecarboxylic acid, 3-carboxydecahydro-6-isoquinolineacetic acid, and decahydro-6-(phosphonomethyl)-3-isoquinolinemcarboxylic acid. These compounds are said to be useful for treating a variety of disorders including 15 neurological disorders, stroke, cerebral ischemia and others.

Further, many multicyclic carboxamide compounds other than the compounds of the invention are known:

I. N-[(methoxy-5-(trifluoromethyl)-1-naphthalenyl)-carbonyl]-N-[(ethoxy)carbonyl]glycine, shown in Sestanj et al., U.S. Patent No. 4,925,968, issued May 15, 1990. The N-acyl-N-naphthoylglycines of Sestanj et al. are said to be useful for treating diabetes mellitus and complications thereof, such as neuropathy, nephropathy, retinopathy and cataracts.

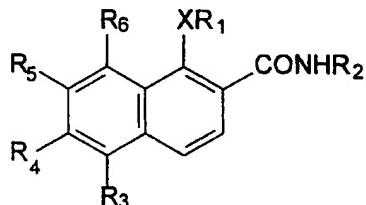

II. 4-bromo-N-{2-[4-(2,3-dichlorophenyl)-1-piperazinyl]ethyl}-1-methoxy-2-naphthalenecarboxamide, shown in Glase et al., U.S. Patent No. 5,395,835, issued March 7, 1995. Glase et al. discloses compounds having the formula:

These compounds are disclosed as dopaminergic agents useful for treating, for example, psychotic depression, substance

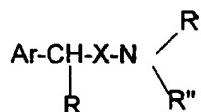

abuse and compulsive disorders.

III. 7-methoxy-1-(1-methylethoxy)-2-naphthalene-carboxamide, shown in Boschelli et al., U.S. Patent No. 5,434,188, issued July 18, 1995. Boschelli et al. discloses 5 naphthalene carboxamides having the structure:

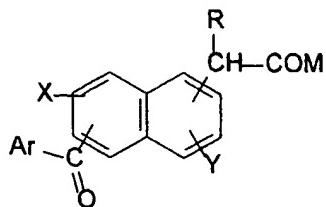

where X is O or S(O)_n.

IV. N,N-dimethyl-3-methyl-2- α -naphthyl pentanamide, shown in Eberle et al., U.S. Patent No. 3,573,304, issued 10 March 30, 1971. Eberle et al. discloses compounds having the formula:

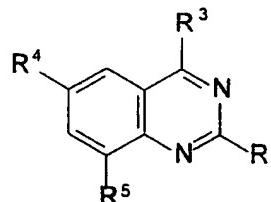

where X is a carbonyl or methylene radical. These compounds are used to prevent the adhesion of leukocytes to endothelial 15 cells. Indications are said to include the treatment of AIDS, rheumatoid arthritis, osteoarthritis, asthma, psoriasis, respiratory distress syndrome, reperfusion injury, ischemia, ulcerative colitis, vasculaditis, atherosclerosis, inflammatory bowel disease and tumor metastasis.

20 V. 1-benzoyl-3-methyl-7-nitronaphthalene and 1-benzoyl-2-methyl-6-nitronaphthalene, shown in Witzel, U.S. Patent No. 3,899,529, issued August 12, 1975. Witzel discloses aroyl-substituted naphthalene acetic acid compounds having the formula:

where X, Y and M can each be an amino group. These compounds are said to be useful for treating fever, pain and inflammation.

- 5 VI. (1,1'-biphenyl-4-yl)-4-quinazolinecarboxylic acid, shown in Hesson, U.S. Patent No. 4,639,454, issued January 27, 1987. Hesson discloses quinazoline-4-carboxylic acid having
the formula:

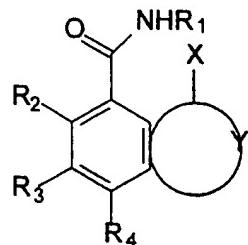

- 10 The Hesson compounds are said to have a tumor-inhibiting effect.

It is not believed that the above disclosed compounds have been shown to inhibit PARP activity per se.

15

SUMMARY OF THE INVENTION

The present invention is directed to compounds having the following formula I:

I

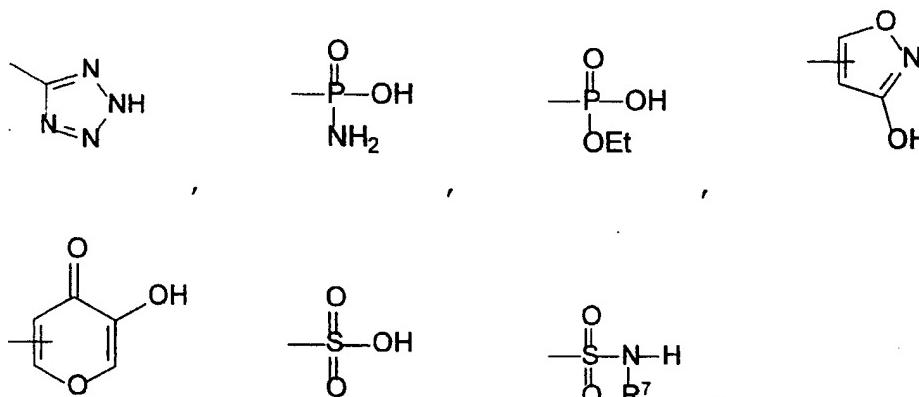

20

or a pharmaceutically acceptable salt, hydrate, ester,

solvate, prodrug, metabolite, stereoisomer, or mixtures thereof; wherein:

Y represents the atoms necessary to form a fused 5- to 6-membered, aromatic or non-aromatic, carbocyclic or N-containing heterocyclic ring, wherein Y and any heteroatom(s) therein are unsubstituted or independently substituted with at least one non-interfering alkyl, alkenyl, cycloalkyl, cycloalkenyl, aralkyl, aryl, carboxy or halo substituent;

X is at the 1-position of ring Y and is -COOR₅ or a substituted or unsubstituted moiety selected from the group consisting of

and , wherein R⁷ is hydrogen, alkyl, alkenyl, cycloalkyl or cycloalkenyl, and is itself either unsubstituted or substituted with an alkyl, alkenyl, cycloalkyl or cycloalkenyl group;

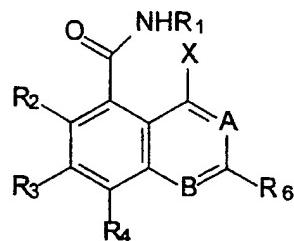

R₁ is hydrogen, alkyl, alkenyl, cycloalkyl or cycloalkenyl, and is itself either unsubstituted or substituted with an alkyl, alkenyl, cycloalkyl or cycloalkenyl group;

R₂, R₃, R₄ and R₅ are independently hydrogen, alkyl, alkenyl, cycloalkyl, cycloalkenyl, aralkyl, aryl, amino, hydroxyl, 1-piperazine, 1-piperidine, or 1-imidazoline, and are either unsubstituted or

substituted with a moiety selected from the group consisting of alkyl, alkenyl, alkoxy, phenoxy, benzyloxy, cycloalkyl, cycloalkenyl, hydroxy, carboxy, carbonyl, amino, amido, cyano, isocyano, nitro, nitroso, nitrilo, isonitrilo, imino, azo, diazo, sulfonyl, sulfoxy, thio, thiocarbonyl, sulfhydryl, halo, haloalkyl, trifluoromethyl, aralkyl and aryl;

provided that, when Y is a fused, 6-membered, aromatic carbocyclic ring, and R₁, R₂, R₃ and R₄ are each hydrogen, X is not a -COOH group.

A particularly preferred embodiment of the invention has formula II:

II

15

or a pharmaceutically acceptable salt, hydrate, ester, solvate, prodrug, metabolite, stereoisomer, or mixtures thereof; wherein:

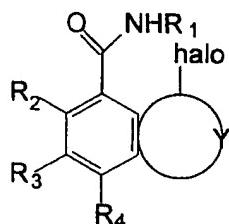

A and B are independently carbon or nitrogen and are 20 optionally and independently unsubstituted or substituted with an alkyl, alkenyl, cycloalkyl, cycloalkenyl, aralkyl or aryl group;

X, R₁, R₂, R₃ and R₄ are defined above; and
25 R₆ and any substituent(s) on A and B are themselves optionally and independently substituted by, without limitation, alkyl, alkenyl, alkoxy, phenoxy, benzyloxy, cycloalkyl, cycloalkenyl, hydroxy, carboxy, carbonyl, amino, amido, cyano, nitro, nitroso, nitrilo, isonitrilo, imino, azo, diazo, sulfonyl, sulfoxy, thio, thiocarbonyl,

sulfhydryl, halo, haloalkyl, trifluoromethyl, aralkyl, aryl, amino, hydroxyl, 1-piperazine, 1-piperidine, and/or 1-imidazoline;

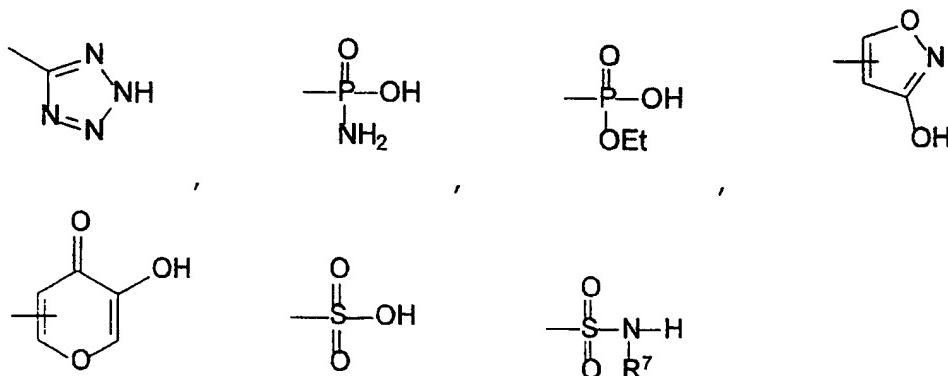

provided that at least one of A and B is nitrogen.

5 In another embodiment, a process for making the compound of formula I comprises the step of contacting an intermediate of formula III:

III

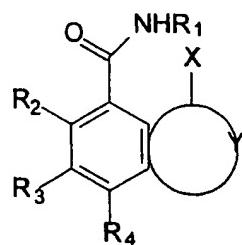

10 with a -COOR₅ radical or a substituted or unsubstituted compound selected from the group consisting of:

and

15 wherein R₁, R₂, R₃, R₄, R₅, R₇ and Y are as defined in above; and "halo" is a chloro, bromo or iodo moiety.

In yet another embodiment, the pharmaceutical composition of the invention comprises a pharmaceutically acceptable carrier and a compound of formula I:

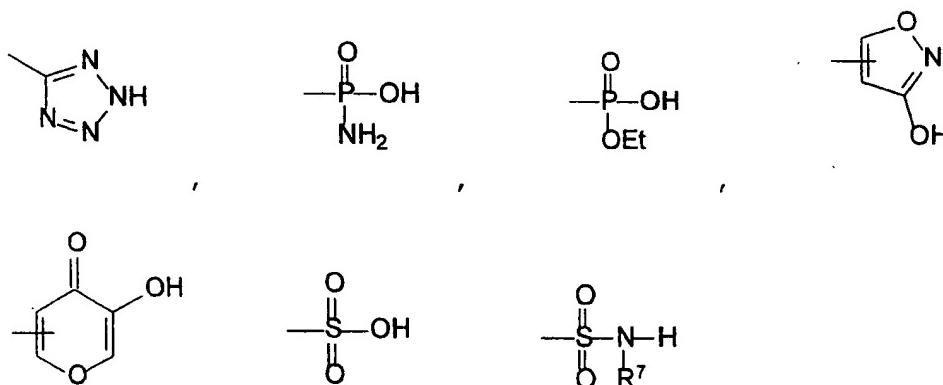

I

or a pharmaceutically acceptable salt, hydrate, ester, solvate, prodrug, metabolite, stereoisomer, or mixtures 5 thereof; wherein:

Y represents the atoms necessary to form a fused 5- to
6-membered, aromatic or non-aromatic, carbocyclic
or N-containing heterocyclic ring, wherein Y and
any heteroatom(s) therein are unsubstituted or
10 independently substituted with at least one non-
interfering alkyl, alkenyl, cycloalkyl,
cycloalkenyl, aralkyl, aryl, carboxy or halo
substituent;

X is at the 1-position of ring Y and is -COOR₅ or a
15 substituted or unsubstituted moiety selected from
the group consisting of

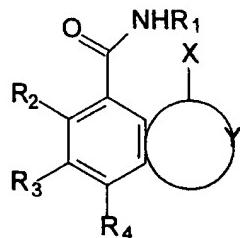

and , wherein R⁷ is
20 hydrogen, alkyl, alkenyl, cycloalkyl or
cycloalkenyl, and is itself either unsubstituted or
substituted with an alkyl, alkenyl, cycloalkyl or
cycloalkenyl group;

R₁ is hydrogen, alkyl, alkenyl, cycloalkyl or cycloalkenyl, and is itself either unsubstituted or substituted with an alkyl, alkenyl, cycloalkyl or cycloalkenyl group;

5 R₂, R₃ and R₄ are independently hydrogen, alkyl, alkenyl, cycloalkyl, cycloalkenyl, aralkyl, aryl, amino, hydroxyl, 1-piperazine, 1-piperidine, or 1-imidazoline, and are themselves either unsubstituted or substituted with a moiety selected from the group consisting of alkyl, alkenyl, 10 alkoxy, phenoxy, benzyloxy, cycloalkyl, cycloalkenyl, hydroxy, carboxy, carbonyl, amino, amido, cyano, isocyano, nitro, nitroso, nitrilo, isonitrilo, imino, azo, diazo, sulfonyl, sulfoxy, 15 thio, thiocarbonyl, sulfhydryl, halo, haloalkyl, trifluoromethyl, aralkyl and aryl; provided that, when Y is a fused, 6-membered, aromatic carbocyclic ring, and R₁, R₂, R₃ and R₄ are each hydrogen, X is not a -COOH group.

20 In a still further embodiment of the invention, the pharmaceutical composition of the invention comprises a pharmaceutically acceptable carrier and a compound of formula I:

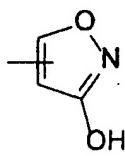

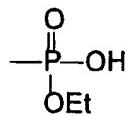

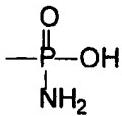

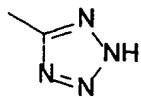

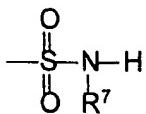

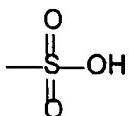

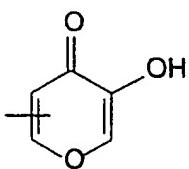

I
25 or a pharmaceutically acceptable salt, hydrate, ester, solvate, prodrug, metabolite, stereoisomer, or mixtures thereof, and a pharmaceutically acceptable carrier, wherein the compound of formula I is present in an amount that is sufficient to inhibit PARP activity, to treat or prevent 30 tissue damage resulting from cell damage or death due to

necrosis or apoptosis, to effect a neuronal activity not mediated by NMDA toxicity, to effect a neuronal activity mediated by NMDA toxicity, to treat neural tissue damage resulting from ischemia and reperfusion injury, neurological disorders and neurodegenerative diseases; to prevent or treat vascular stroke; to treat or prevent cardiovascular disorders; to treat other conditions and/or disorders such as age-related macular degeneration, AIDS and other immune senescence diseases, arthritis, atherosclerosis, cachexia, cancer, degenerative diseases of skeletal muscle involving replicative senescence, diabetes, head trauma, immune senescence, inflammatory bowel disorders (such as colitis and Crohn's disease), muscular dystrophy, osteoarthritis, osteoporosis, chronic and/or acute pain (such as neuropathic pain), renal failure, retinal ischemia, septic shock (such as endotoxic shock), and skin aging; to extend the lifespan and proliferative capacity of cells; to alter gene expression of senescent cells; or to radiosensitize hypoxic tumor cells, and wherein:

20 Y represents the atoms necessary to form a fused 5- to
6-membered, aromatic or non-aromatic, carbocyclic
or N-containing heterocyclic ring, wherein Y and
any heteroatom(s) therein are unsubstituted or
independently substituted with at least one non-
interfering alkyl, alkenyl, cycloalkyl,
cycloalkenyl, aralkyl, aryl, carboxy or halo
substituent;

25 X is at the 1-position of ring Y and is -COOR₅ or a
substituted or unsubstituted moiety selected from
30 the group consisting of

5 , and , wherein R⁷ is hydrogen, alkyl, alkenyl, cycloalkyl or cycloalkenyl, and is itself either unsubstituted or substituted with an alkyl, alkenyl, cycloalkyl or cycloalkenyl group;

R₁ is hydrogen, alkyl, alkenyl, cycloalkyl or cycloalkenyl, and is itself either unsubstituted or substituted with an alkyl, alkenyl, cycloalkyl or cycloalkenyl group;

,, R₃, R₄ and R₅ are independently hydrogen, alkyl, alkenyl, cycloalkyl, cycloalkenyl, aralkyl, aryl, amino, hydroxyl, 1-piperazine, 1-piperidine, or 1-imidazoline, and are either unsubstituted or substituted with a moiety selected from the group consisting of alkyl, alkenyl, alkoxy, phenoxy, benzyloxy, cycloalkyl, cycloalkenyl, hydroxy, carboxy, carbonyl, amino, amido, cyano, isocyano, nitro, nitroso, nitrilo, isonitrilo, imino, azo, diazo, sulfonyl, sulfoxy, thio, thiocarbonyl, sulfhydryl, halo, haloalkyl, trifluoromethyl, aralkyl and aryl.

In a particularly preferred embodiment of the composition, the compound is of formula II, as described above.

In an additional embodiment, a method of inhibiting PARP activity comprises administering a compound of formula I, as described above for the pharmaceutical compositions of the invention. In yet further embodiments, the amount of the compound administered in the methods of the invention is sufficient for treating tissue damage resulting from cell damage or death due to necrosis or apoptosis, neural tissue

damage resulting from ischemia and reperfusion injury, or neurological disorders and neurodegenerative diseases; to prevent or treat vascular stroke; to treat or prevent cardiovascular disorders; to treat other conditions and/or 5 disorders such as age-related macular degeneration, AIDS and other immune senescence diseases, arthritis, atherosclerosis, cachexia, cancer, degenerative diseases of skeletal muscle involving replicative senescence, diabetes, head trauma, immune senescence, inflammatory bowel disorders (such as 10 colitis and Crohn's disease), muscular dystrophy, osteoarthritis, osteoporosis, chronic and/or acute pain (such as neuropathic pain), renal failure, retinal ischemia, septic shock (such as endotoxic shock), and skin aging; to extend the lifespan and proliferative capacity of cells; to alter 15 gene expression of senescent cells; or to radiosensitize hypoxic tumor cells.

BRIEF DESCRIPTION OF THE DRAWINGS

Figure 1 shows the distribution of the cross-sectional 20 infarct area at representative levels along the rostrocaudal axis, as measured from the interaural line in non-treated animals and in animals treated with 10 mg/kg of 3,4-dihydro-5-[4-(1-piperidinyl)-butoxyl]-1(2H)-isoquinolinone.

Figure 2 shows the effect of intraperitoneal 25 administration of 3,4-dihydro-5-[4-(1-piperidinyl)-butoxy]-1(2H)-isoquinolinone on the infarct volume.

DETAILED DESCRIPTION OF THE INVENTION

30 The carboxamide compounds of the present invention inhibit PARP activity. As such, they may treat or prevent neural tissue damage resulting from cell damage or death due to necrosis or apoptosis, cerebral ischemia and reperfusion injury or neurodegenerative diseases in an animal; they may 35 extend the lifespan and proliferative capacity of cells and thus be used to treat or prevent diseases associated

therewith; they may alter gene expression of senescent cells; and they may radiosensitize hypoxic tumor cells. Preferably, the compounds of the invention treat or prevent tissue damage resulting from cell damage or death due to necrosis or 5 apoptosis, and/or effect neuronal activity, either mediated or not mediated by NMDA toxicity. These compounds are thought to interfere with more than the glutamate neurotoxicity and NO-mediated biological pathways. Further, the compounds of the invention can treat or prevent other 10 tissue damage related to PARP activation.

For example, the compounds of the invention can treat or prevent cardiovascular tissue damage resulting from cardiac ischemia or reperfusion injury. Reperfusion injury, for instance, occurs at the termination of cardiac bypass 15 procedures or during cardiac arrest when the heart, once prevented from receiving blood, begins to reperfuse.

The compounds of the present invention can also be used to extend or increase the lifespan or proliferation of cells and thus to treat or prevent diseases associated therewith 20 and induced or exacerbated by cellular senescence including skin aging, atherosclerosis, osteoarthritis, osteoporosis, muscular dystrophy, degenerative diseases of skeletal muscle involving replicative senescence, age-related macular degeneration, immune senescence, AIDS and other immune 25 senescence diseases, and other diseases associated with cellular senescence and aging, as well as to alter the gene expression of senescent cells. These compounds can also be used to treat cancer and to radiosensitize hypoxic tumor cells to render the tumor cells more susceptible to radiation 30 therapy and to prevent the tumor cells from recovering from potentially lethal damage of DNA after radiation therapy, presumably by their ability to prevent DNA repair. The compounds of the present invention can be used to prevent or treat vascular stroke; to treat or prevent cardiovascular 35 disorders; to treat other conditions and/or disorders such as age-related macular degeneration, AIDS and other immune

senescence diseases, arthritis, atherosclerosis, cachexia, cancer, degenerative diseases of skeletal muscle involving replicative senescence, diabetes, head trauma, immune senescence, inflammatory bowel disorders (such as colitis and 5 Crohn's disease), muscular dystrophy, osteoarthritis, osteoporosis, chronic and/or acute pain (such as neuropathic pain), renal failure, retinal ischemia, septic shock (such as endotoxic shock), and skin aging.

Preferably, the compounds of the invention act as PARP 10 inhibitors to treat or prevent tissue damage resulting from cell death or damage due to necrosis or apoptosis; to treat or prevent neural tissue damage resulting from cerebral ischemia and reperfusion injury or neurodegenerative diseases in an animal; to extend and increase the lifespan and 15 proliferative capacity of cells; to alter gene expression of senescent cells; and to radiosensitize tumor cells. These compounds are thought to interfere with more than the NMDA-neurotoxicity and NO-mediated biological pathways. Preferably, the compounds of the invention exhibit an IC₅₀ for 20 inhibiting PARP in vitro of about 100 μM or lower, more preferably, about 25 μM or lower.

As used herein, the term "cardiovascular disorders" refers to those disorders that can either cause ischemia or are caused by reperfusion of the heart. Examples include, 25 but are not limited to, coronary artery disease, angina pectoris, myocardial infarction, cardiovascular tissue damage caused by cardiac arrest, cardiovascular tissue damage caused by cardiac bypass, cardiogenic shock, and related conditions that would be known by those of ordinary skill in the art or 30 which involve dysfunction of or tissue damage to the heart or vasculature, especially, but not limited to, tissue damage related to PARP activation.

The term "ischemia" refers to localized tissue anemia due to obstruction of the inflow of arterial blood. Global 35 ischemia occurs when blood flow to the entire brain ceases for a period of time. Global ischemia may result from

cardiac arrest. Focal ischemia occurs when a portion of the brain is deprived of its normal blood supply. Focal ischemia may result from thromboembolic occlusion of a cerebral vessel, traumatic head injury, edema or brain tumor. Even if 5 transient, both global and focal ischemia can cause widespread neuronal damage. Although nerve tissue damage occurs over hours or even days following the onset of ischemia, some permanent nerve tissue damage may develop in the initial minutes following the cessation of blood flow to 10 the brain. Much of this damage has been attributed to glutamate toxicity and to the secondary consequences of tissue reperfusion, such as the release of vasoactive products by damaged endothelium and the release of cytotoxic products, such as free radicals and leukotrienes, by the 15 damaged tissue. Ischemia can also occur in the heart in myocardial infarction and other cardiovascular disorders in which the coronary arteries have been obstructed as a result of atherosclerosis, thrombi, or spasm.

The term "neural tissue damage resulting from ischemia 20 and reperfusion injury and neurodegenerative diseases" includes neurotoxicity, such as seen in vascular stroke and global and focal ischemia.

The term "neurodegenerative diseases" includes Alzheimer's disease, Parkinson's disease and Huntington's 25 disease.

The term "nervous insult" refers to any damage to nervous tissue and any disability or death resulting therefrom. The cause of nervous insult may be metabolic, toxic, neurotoxic, iatrogenic, thermal or chemical, and 30 includes without limitation, ischemia, hypoxia, cerebrovascular accident, trauma, surgery, pressure, mass effect, hemorrhage, radiation, vasospasm, neurodegenerative disease, infection, Parkinson's disease, amyotrophic lateral sclerosis (ALS), myelination/demyelination process, epilepsy, 35 cognitive disorder, glutamate abnormality and secondary effects thereof.

The term "nervous tissue" refers to the various components that make up the nervous system including, without limitation, neurons, neural support cells, glia, Schwann cells, vasculature contained within and supplying these structures, the central nervous system, the brain, the brain stem, the spinal cord, the junction of the central nervous system with the peripheral nervous system, the peripheral nervous system, and allied structures.

The term "neuroprotective" refers to the effect of reducing, arresting or ameliorating nervous insult, and protecting, resuscitating, or reviving nervous tissue that has suffered nervous insult.

The term "preventing neurodegeneration" includes the ability to prevent neurodegeneration in patients diagnosed as having a neurodegenerative disease or who are at risk of developing a neurodegenerative disease. The term also encompasses preventing further neurodegeneration in patients who are already suffering from or have symptoms of a neurodegenerative disease.

20 The term "treating" refers to:

(i) preventing a disease, disorder or condition from occurring in an animal that may be predisposed to the disease, disorder and/or condition, but has not yet been diagnosed as having it;

25 (ii) inhibiting the disease, disorder or condition, i.e., arresting its development; and

 (iii) relieving the disease, disorder or condition, i.e., causing regression of the disease, disorder and/or condition.

30 The term "cancer" is interpreted broadly. The compounds of the present invention can be "anti-cancer agents", which term also encompasses "anti-tumor cell growth agents" and "anti-neoplastic agents".

The term "isomers" refer to compounds having the same 35 number and kind of atoms, and hence, the same molecular weight, but differing in respect to the arrangement or

configuration of the atoms. "Stereoisomers" are isomers that differ only in the arrangement of atoms in space. "Enantiomers" are a pair of stereoisomers that are non-superimposable mirror images of each other.

5 "Diastereoisomers" are stereoisomers which are not mirror images of each other. "Racemic mixture" means a mixture containing equal, or roughly equal, parts of individual enantiomers. A "non-racemic mixture" is a mixture containing unequal, or substantially unequal, parts of
10 individual enantiomers or stereoisomers.

The term "radiosensitizer", as used herein, is defined as a molecule, preferably a low molecular weight molecule, administered to animals in therapeutically effective amounts to increase the sensitivity of the cells to be
15 radiosensitized to electromagnetic radiation and/or to promote the treatment of diseases which are treatable with electromagnetic radiation. Diseases which are treatable with electromagnetic radiation include neoplastic diseases, benign and malignant tumors, and cancerous cells. Electromagnetic
20 radiation treatment of other diseases not listed herein are also contemplated by the present invention. The terms "electromagnetic radiation" and "radiation" as used herein includes, but is not limited to, radiation having the wavelength of 10^{-10} to 10^3 meters. Preferred embodiments of
25 the present invention employ the electromagnetic radiation of: gamma-radiation (10^{-20} to 10^{-13} m) x-ray radiation (10^{-11} to 10^{-9} m), ultraviolet light (10 nm to 400 nm), visible light (400 nm to 700 nm), infrared radiation (700 nm to 1.0 mm), and microwave radiation (1 mm to 30 cm).

30 Radiosensitizers are known to increase the sensitivity of cancerous cells to the toxic effects of electromagnetic radiation. Several mechanisms for the mode of action of radiosensitizers have been suggested in the literature including: hypoxic cell radiosensitizers (e.g., 2-
35 nitrcimidazole compounds, and benzotriazine dioxide compounds) promote the reoxygenation of hypoxic tissue and/or

catalyze the generation of damaging oxygen radicals; non-hypoxic cell radiosensitizers (e.g., halogenated pyrimidines) can be analogs of DNA bases and preferentially incorporate into the DNA of cancer cells and thereby promote the 5 radiation-induced breaking of DNA molecules and/or prevent the normal DNA repair mechanisms; and various other potential mechanisms of action have been hypothesized for radiosensitizers in the treatment of disease.

Many cancer treatment protocols currently employ 10 radiosensitizers activated by the electromagnetic radiation of x-rays. Examples of x-ray activated radiosensitizers include, but are not limited to, the following: metronidazole, misonidazole, desmethylmisonidazole, pimonidazole, etanidazole, nimorazole, mitomycin C, RSU 1069, 15 SR 4233, EO9, RB 6145, nicotinamide, 5-bromodeoxyuridine (BUDR), 5-iododeoxyuridine (IUDR), bromodeoxycytidine, fluorodeoxyuridine (FudR), hydroxyurea, cisplatin, and therapeutically effective analogs and derivatives of the same.

20 Photodynamic therapy (PDT) of cancers employs visible light as the radiation activator of the sensitizing agent. Examples of photodynamic radiosensitizers include the following, but are not limited to: hematoporphyrin derivatives, Photofrin, benzoporphyrin derivatives, NPe6, tin 25 etioporphyrin SnET2, pheoborbide-a, bacteriochlorophyll-a, naphthalocyanines, phthalocyanines, zinc phthalocyanine, and therapeutically effective analogs and derivatives of the same.

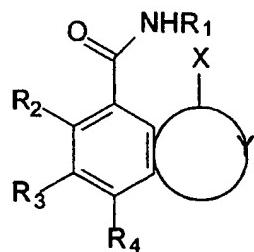

Radiosensitizers may be administered in conjunction with 30 a therapeutically effective amount of one or more other compounds, including but not limited to: compounds which promote the incorporation of radiosensitizers to the target cells; compounds which control the flow of therapeutics, nutrients, and/or oxygen to the target cells; 35 chemotherapeutic agents which act on the tumor with or without additional radiation; or other therapeutically

effective compounds for treating cancer or other disease. Examples of additional therapeutic agents that may be used in conjunction with radiosensitizers include, but are not limited to: 5-fluorouracil, leucovorin, 5'-amino-5 5'deoxythymidine, oxygen, carbogen, red cell transfusions, perfluorocarbons (e.g., Fluosol-DA), 2,3-DPG, BW12C, calcium channel blockers, pentoxyfylline, antiangiogenesis compounds, hydralazine, and L-BSO. Examples of chemotherapeutic agents that may be used in conjunction with radiosensitizers 10 include, but are not limited to: adriamycin, camptothecin, carboplatin, cisplatin, daunorubicin, docetaxel, doxorubicin, interferon (alpha, beta, gamma), interleukin 2, irinotecan, paclitaxel, topotecan, and therapeutically effective analogs and derivatives of the same.

15 The inventors have now discovered that select carboxamide compounds can inhibit PARP activity and can ameliorate tissue damage resulting from cell damage or death due to necrosis or apoptosis and/or neural tissue damage, including that following focal ischemia and reperfusion 20 injury; can increase or extend the lifespan or proliferation of cells; can alter gene expression in senescent cells; and can radiosensitize tumor cells. Generally, inhibition of PARP activity spares the cell from energy loss, preventing irreversible depolarization of the neurons and, thus, 25 provides neuroprotection. While not wishing to be bound thereby, it is thought that PARP activation may play a common role in still other excitotoxic mechanisms, perhaps as yet undiscovered, in addition to the production of free radicals and NO. Since PARP is necessary for DNA repair, the 30 inhibition of PARP can also be used to prevent radiation damaged tumor cells from recovering from potentially lethal damage of DNA by preventing DNA repair. PARP inhibitors may also be used to extend or increase the lifespan and proliferation of cells and to thus prevent or treat diseases 35 and conditions associated with cellular senescence, and can be used to alter the gene expression of senescent cells.

The compounds of the invention act as PARP inhibitors to treat or prevent tissue damage resulting from cell damage or death due to necrosis or apoptosis; to treat or prevent neural tissue damage resulting from cerebral ischemia and reperfusion injury or neuro-degenerative diseases in a mammal; to extend and increase the lifespan and proliferative capacity of cells; to alter gene expression of senescent cell; and to radiosensitize tumor cells. These compounds are thought to interfere with more than the NMDA-neurotoxicity and NO-mediated biological pathways. Preferably, the compounds of the invention exhibit an IC₅₀ for inhibiting PARP in vitro of about 100 μM or lower, more preferably, about 25 μM or lower.

The compound of the invention has formula I:

15

I

or a pharmaceutically acceptable salt, hydrate, ester, solvate, prodrug, metabolite, stereoisomer, or mixtures thereof, wherein Y represents the atoms necessary to form a fused 5- to 6-membered, aromatic or non-aromatic, carbocyclic or N-containing heterocyclic ring, wherein Y and any heteroatom(s) therein are unsubstituted or independently substituted with at least one non-interfering alkyl, alkenyl, cycloalkyl, cycloalkenyl, aralkyl, aryl, carboxy or halo substituent.

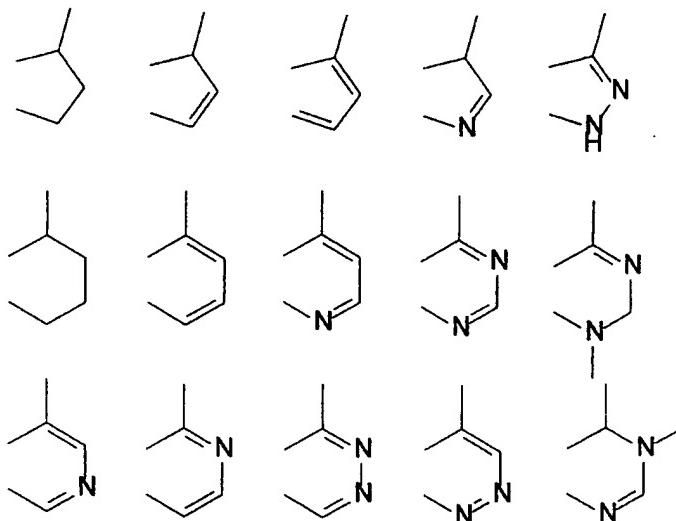

When Y forms a fused 5-membered carbocyclic ring, examples thereof include such rings as fused cyclopentane, cyclopentene, cyclopentadiene and the like. When Y forms a 5-membered N-containing heterocyclic ring, examples thereof include such rings as fused pyrrole, isopyrrole, imidazole,

isoimidazole, pyrazole, pyrrolidine, pyrroline, imidazolidine, imidazoline, pyrazolidine, pyrazoline and the like rings.

When Y forms a fused 6-membered carbocyclic ring, 5 examples thereof include such rings as fused cyclohexane, cyclohexene, benzene and the like. When Y forms a 6-membered N-containing heterocyclic ring, examples thereof include such rings as pyridine, pyrazine, pyrimidine, pyridazine, piperidine, piperazine, morpholine and the like rings.

10 Y may be aromatic, such as pyrrole, benzene or pyridine, or non-aromatic such as cyclopentene, piperidyl or piperazinyl.

Specific examples of particularly useful Y structures are shown below:

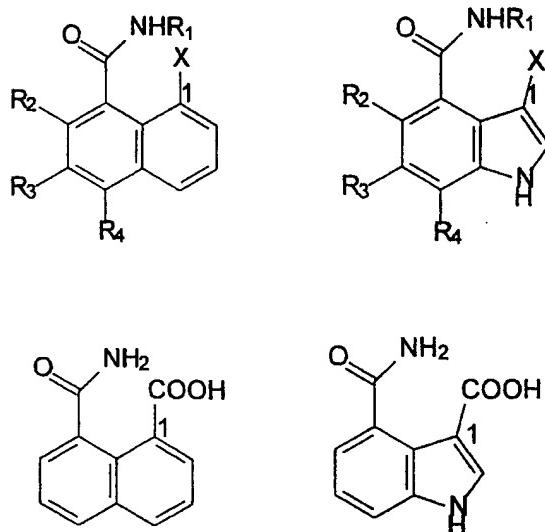

15

In a preferred embodiment, however, Y has at least one site of unsaturation. Even more preferably, Y forms a fused benzene ring.

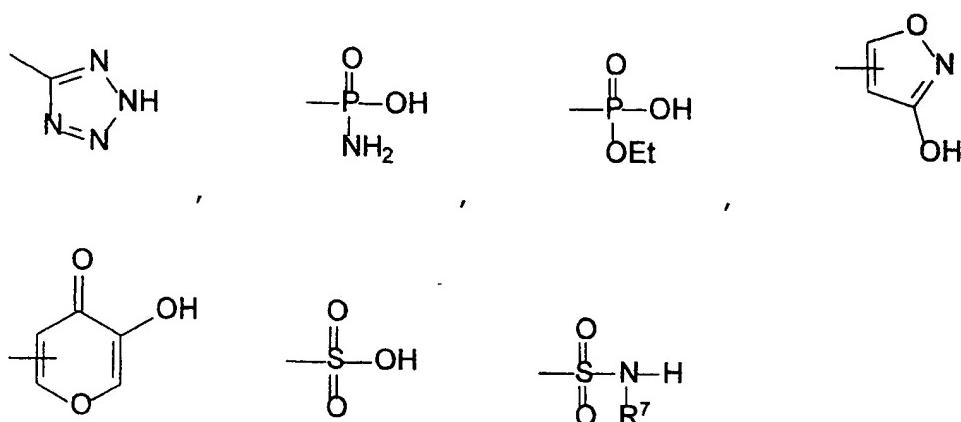

Y can be unsubstituted or substituted with one or more 20 non-interfering substituents. For example, Y can be substituted with an alkyl group, such as methyl, ethyl, isopropyl, t-butyl, n-pentyl, 2-methylhexyl, dodecyl, octadecyl and the like; with an alkenyl group, such as vinyl, ethenyl, isopropenyl, 2,2-dimethyl-1-propenyl, decenyl,

hexadecenyl and the like; with a cycloalkyl group, such as adamantyl, cyclobutyl, cyclohexyl, cycloheptyl, 3-methyl-1-cyclodecyl and the like; with a cycloalkenyl group, such as cyclopropenyl, cyclopentadienyl, cyclohexenyl, cyclooctenyl and the like; with an aralkyl group, such as benzyl, 3-(1)-naphthyl-1-propyl, methylbenzyl, ethylbenzyl, propylbenzyl, n-propylbenzyl, butylbenzyl, n-butylbenzyl, isobutylbenzyl, sec-butylbenzyl, tert-butylbenzyl and the like; or with an aryl group such as phenyl, naphthyl, anthracenyl, pyridinyl, thienyl and the like.

The X group attached to the Y ring in formula I is attached at the 1-position. The "1-position" is defined as the non-shared ring position on the Y ring that is two carbons away from the carbon attached to the amide group (on the adjacent non-Y ring). The examples below further indicate what is meant by the "1-position":

The X group may be a carboxylic acid (-COOH), a carboxylic acid analogue (-COOR₅), or any useful carboxylic acid mimic. Examples of useful carboxylic acid mimics include:

and

wherein R¹ is alkyl, alkenyl, cycloalkyl, cycloalkenyl,
5 aralkyl or aryl, such as described above for Y substituents.
R¹ may also be either unsubstituted or substituted with one
or more non-interfering substituents, such as the alkyl,
alkenyl, cycloalkyl and cycloalkenyl groups described above.
The above carboxylic acid mimics are shown in R. Silverman,
10 *The Organic Chemistry of Drug Design and Drug Action*,
Academic Press (1992).

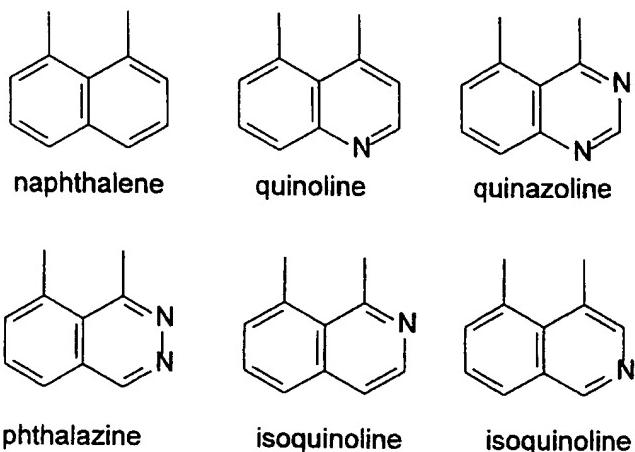

R₁ may be alkyl, alkenyl, cycloalkyl or cycloalkenyl group. Examples of useful alkyl groups include, without limitation, methyl, ethyl, propyl, butyl, pentyl, hexyl,
15 isopropyl, isobutyl, tert-butyl, n-pentyl, 2-methylpentyl and the like. Examples of useful alkenyl groups include, without limitation, ethenyl, propenyl, butenyl, pentenyl, 2-methylpentenyl and the like. Examples of useful cycloalkyl groups include cyclobutyl, cyclopentyl, cyclohexyl,
20 adamantlyl, cycloheptyl, cyclooctyl, cyclononyl, cyclodecyl and the like. Examples of useful cycloalkenyl groups include cyclobutenyl, cyclopentenyl, cyclohexenyl, cycloheptenyl, cyclooctenyl, cyclononenyl, cyclodeceny and the like. R₁ may itself be unsubstituted or substituted with one or more
25 additional alkyl, alkenyl, cycloalkyl or cycloalkenyl groups.

R₂, R₃, R₄ and R₅ are independently hydrogen, alkyl, alkenyl, cycloalkyl, cycloalkenyl or aralkyl, as described above. Additionally, R₂, R₃, R₄ and R₅ can be an aryl group or

amino, hydroxyl, 1-piperazine, 1-piperidine, or 1-imidazoline. "Aryl" is defined as an unsaturated carbocyclic or heterocyclic moiety that may be either unsubstituted or substituted with one or more non-interfering substituent(s). Examples of aryl groups include, without limitation, phenyl, benzyl, naphthyl, indenyl, azulenyl, fluorenyl, anthracenyl, indolyl, isoindolyl, indolinyl, benzofuranyl, benzothiophenyl, indazolyl, benzimidazolyl, benzothiazolyl, tetrahydrofuranyl, tetrahydropyranyl, pyridyl, pyrrolyl, pyrrolidinyl, pyridinyl, pyrimidinyl, purinyl, quinolinyl, isoquinolinyl, tetrahydroquinolinyl, quinolizinyl, furyl, thiophenyl, imidazolyl, oxazolyl, benzoxazolyl, thiazolyl, isoxazolyl, isotriazolyl, oxadiazolyl, triazolyl, thiadiazolyl, pyridazinyl, pyrimidinyl, pyrazolyl, pyrazolinyl, pyrazolidinyl, thienyl, tetra-hydroisoquinolinyl, cinnolinyl, phthalazinyl, quinazolinyl, quinoxalinyl, naphthyridinyl, pteridinyl, carbazolyl, acridinyl, phenazinyl, phenothiazinyl, phenoxazinyl and the like.

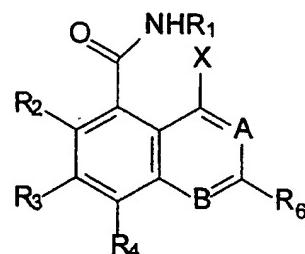

Possible substituents on an aryl group can be any non-interfering substituent. However, preferred substituents include, without limitation, alkyl, alkenyl, alkoxy, phenoxy, benzyloxy, cycloalkyl, cycloalkenyl, hydroxy, carboxy, carbonyl, amino, amido, cyano, isocyano, nitro, nitroso, nitrilo, isonitrilo, imino, azo, diazo, sulfonyl, sulfoxy, thic, thiocarbonyl, sulfhydryl, halo, haloalkyl, trifluoromethyl, aralkyl and aryl.

In the compound of the invention, the multicyclic nuclear ring structure formed with the fused Y ring preferably has an isoquinoline, a quinoline, a naphthalene, a phenanthridine, a phthalazine, a phthalhydrazide, or a quinazoline nucleus. More preferably, the nucleus is one of the following:

Even more preferably, the compound has an isoquinoline, a quinoline, or a naphthalene nucleus.

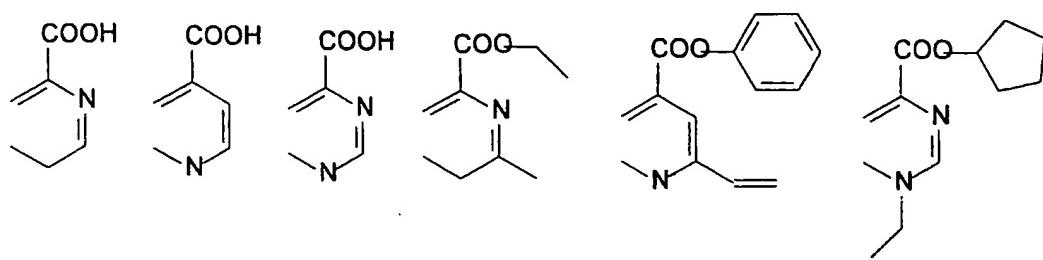

A preferred embodiment of the invention is the compound 5 of formula II:

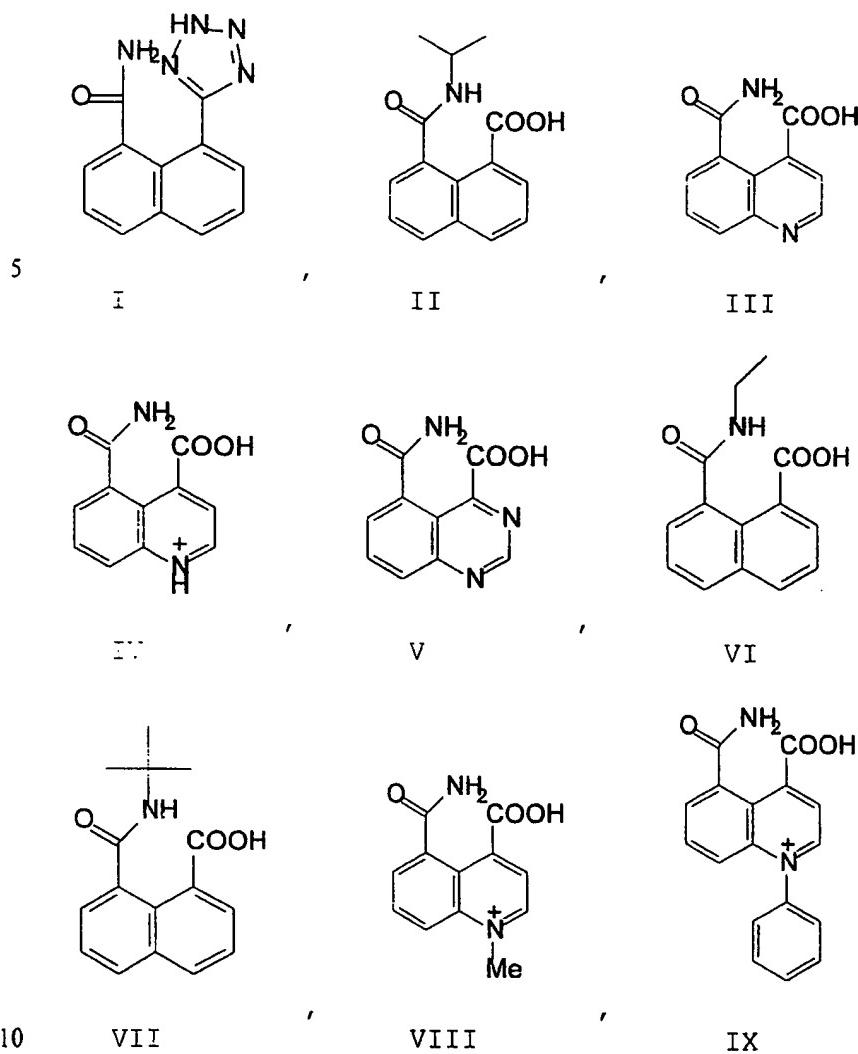

II

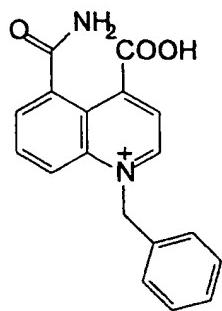

or a pharmaceutically acceptable salt, hydrate, ester, solvate, prodrug, metabolite, stereoisomer, or mixtures 10 thereof, wherein A and B are independently carbon or nitrogen, with the proviso that at least one of A and B is nitrogen. The ring formed by A and B may be unsubstituted or independently substituted with a non-interfering alkyl, alkenyl, cycloalkyl, cycloalkenyl, aralkyl or aryl group.

15 Examples of useful fused rings containing A and B in formula II include:

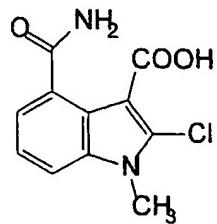

Specific examples of particularly preferred compounds of the invention are shown below:

- 10 In the compositions and methods of the invention, when Y is a fused, 6-membered, aromatic carbocyclic ring, and R₁, R₂, R₃, and R₄ are each hydrogen, X is preferably a -COOH group. In other words, for the compositions and methods of the invention, the compound of formula I is preferably
 15 Compound XIX above, 8-carboxynaphthalene-1-carboxamide.

The compounds of the invention may be useful in a free base form, in the form of pharmaceutically acceptable salts, pharmaceutically acceptable hydrates, pharmaceutically acceptable esters, pharmaceutically acceptable solvates, 5 pharmaceutically acceptable prodrugs, pharmaceutically acceptable metabolites, and in the form of pharmaceutically acceptable stereoisomers. These forms are all within the scope of the invention. In practice, the use of these forms amounts to use of the neutral compound.

10 "Pharmaceutically acceptable salt", "hydrate", "ester" or "solvate" refers to a salt, hydrate, ester, or solvate of the inventive compounds which possesses the desired pharmacological activity and which is neither biologically nor otherwise undesirable. Organic acids can be used to 15 produce salts, hydrates, esters, or solvates such as acetate, adipate, alginate, aspartate, benzoate, benzenesulfonate, p-toluenesulfonate, bisulfate, sulfamate, sulfate, naphthylate, butyrate, citrate, camphorate, camphorsulfonate, cyclopentane-propionate, digluconate, dodecylsulfate, 20 ethanesulfonate, fumarate, glucoheptanoate, glycerophosphate, hemisulfate heptanoate, hexanoate, 2-hydroxyethanesulfonate, lactate, maleate, methanesulfonate, 2-naphthalenesulfonate, nicotinate, oxalate, tosylate and undecanoate. Inorganic acids can be used to produce salts, hydrates, esters, or 25 solvates such as hydrochloride, hydrobromide, hydrcioidide, and thiocyanate.

Examples of suitable base salts, hydrates, esters, or solvates include hydroxides, carbonates, and bicarbonates of ammonia, alkali metal salts such as sodium, lithium and 30 potassium salts, alkaline earth metal salts such as calcium and magnesium salts, aluminum salts, and zinc salts.

Salts, hydrates, esters, or solvates may also be formed with organic bases. Organic bases suitable for the formation of pharmaceutically acceptable base addition salts, hydrates, 35 esters, or solvates of the compounds of the present invention include those that are non-toxic and strong enough to form

such salts, hydrates, esters, or solvates. For purposes of illustration, the class of such organic bases may include mono-, di-, and trialkylamines, such as methylamine, dimethylamine, triethylamine and dicyclohexylamine; mono-, 5 di- or trihydroxyalkylamines, such as mono-, di-, and triethanolamine; amino acids, such as arginine and lysine; guanidine; N-methyl-glucosamine; N-methyl-glucamine; L-glutamine; N-methyl-piperazine; morpholine; ethylenediamine; N-benzyl-phenethylamine; (trihydroxy-methyl)aminoethane; and 10 the like. See, for example, "Pharmaceutical Salts," *J. Pharm. Sci.*, 66:1, 1-19 (1977). Accordingly, basic nitrogen-containing groups can be quaternized with agents including: lower alkyl halides such as methyl, ethyl, propyl, and butyl chlorides, bromides and iodides; dialkyl sulfates such as 15 dimethyl, diethyl, dibutyl and diamyl sulfates; long chain halides such as decyl, lauryl, myristyl and stearyl chlorides, bromides and iodides; and aralkyl halides such as benzyl and phenethyl bromides.

The acid addition salts, hydrates, esters, or solvates 20 of the basic compounds may be prepared either by dissolving the free base of a PARP inhibitor in an aqueous or an aqueous alcohol solution or other suitable solvent containing the appropriate acid or base, and isolating the salt by evaporating the solution. Alternatively, the free base of 25 the PARP inhibitor may be reacted with an acid, as well as reacting the PARP inhibitor having an acid group thereon with a base, such that the reactions are in an organic solvent, in which case the salt separates directly or can be obtained by concentrating the solution.

30 "Pharmaceutically acceptable prodrug" refers to a derivative of the inventive compounds which undergoes biotransformation prior to exhibiting its pharmacological effect(s). The prodrug is formulated with the objective(s) of improved chemical stability, improved patient acceptance 35 and compliance, improved bioavailability, prolonged duration of action, improved organ selectivity, improved formulation

(e.g., increased hydrosolubility), and/or decreased side effects (e.g., toxicity). The prodrug can be readily prepared from the inventive compounds using methods known in the art, such as those described by *Burger's Medicinal Chemistry and Drug Chemistry*, Fifth Ed., Vol. 1, pp. 172-178, 949-982 (1995). For example, the inventive compounds can be transformed into prodrugs by converting one or more of the hydroxy or carboxy groups into esters.

"Pharmaceutically acceptable metabolite" refers to drugs 10 that have undergone a metabolic transformation. After entry into the body, most drugs are substrates for chemical reactions that may change their physical properties and biologic effects. These metabolic conversions, which usually affect the polarity of the compound, alter the way in which 15 drugs are distributed in and excreted from the body. However, in some cases, metabolism of a drug is required for therapeutic effect. For example, anticancer drugs of the antimetabolite class must be converted to their active forms after they have been transported into a cancer cell. Since 20 must drugs undergo metabolic transformation of some kind, the biochemical reactions that play a role in drug metabolism may be numerous and diverse. The main site of drug metabolism is the liver, although other tissues may also participate.

A feature characteristic of many of these 25 transformations is that the metabolic products are more polar than the parent drugs, although a polar drug does sometimes yield a less polar product. Substances with high lipid/water partition coefficients, which pass easily across membranes, also diffuse back readily from tubular urine through the 30 renal tubular cells into the plasma. Thus, such substances tend to have a low renal clearance and a long persistence in the body. If a drug is metabolized to a more polar compound, one with a lower partition coefficient, its tubular reabsorption will be greatly reduced. Moreover, the specific 35 secretory mechanisms for anions and cations in the proximal renal tubules and in the parenchymal liver cells operate upon

highly polar substances.

As a specific example, phenacetin (acetophenetidin) and acetanilide are both mild analgesic and antipyretic agents, but are transformed within the body to a more polar and more effective metabolite, p-hydroxyacetanilid (acetaminophen), which is widely used today. When a dose of acetanilid is given to a person, the successive metabolites peak and decay in the plasma sequentially. During the first hour, acetanilid is the principal plasma component. In the second hour, as the acetanilid level falls, the metabolite acetaminophen concentration reaches a peak. Finally, after a few hours, the principal plasma component is a further metabolite that is inert and can be excreted from the body. Thus, the plasma concentrations of one or more metabolites, as well as the drug itself, can be pharmacologically important.

The reactions involved in drug metabolism are often classified into two groups, as shown in the Table I. Phase I (or functionalization) reactions generally consist of (1) oxidative and reductive reactions that alter and create new functional groups and (2) hydrolytic reactions that cleave esters and amides to release masked functional groups. These changes are usually in the direction of increased polarity.

Phase II reactions are conjugation reactions in which the drug, or often a metabolite of the drug, is coupled to an endogenous substrate, such as glucuronic acid, acetic acid, or sulfuric acid.

TABLE I

Phase I Reactions (functionalization reactions):

- (1) Oxidation via the hepatic microsomal P450 system:
Aliphatic oxidation
Aromatic hydroxylation
N-Dealkylation
O-Dealkylation
S-Dealkylation
Epoxidation
Oxidative deamination
Sulfoxide formation
Desulfuration

N-Oxidation and N-hydroxylation
Dehalogenation

- 5 (2) Oxidation via non-microsomal mechanisms:
Alcohol and aldehyde oxidation
Purine oxidation
Oxidative deamination (monoamine oxidase
and diamine oxidase)
- 10 (3) Reduction:
Azo and nitro reduction
- 15 (4) Hydrolysis:
Ester and amide hydrolysis
Peptide bond hydrolysis
Epoxide hydration

Phase II Reactions (conjugation reactions):

- 20 (1) Glucuronidation
 (2) Acetylation
 (3) Mercapturic acid formation

 (4) Sulfate conjugation
 (5) N-, O-, and S-methylation
25 (6) Trans-sulfuration

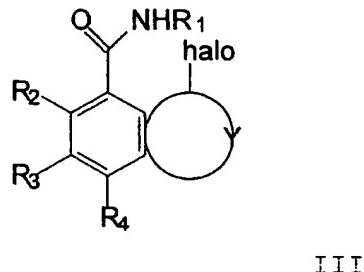

The compounds of the present invention possess one or more asymmetric center(s) and thus can be produced as mixtures (racemic and non-racemic) of stereoisomers, or as individual R- and S-stereoisomers. The individual 30 stereoisomers may be obtained by using an optically active starting material, by resolving a racemic or non-racemic mixture of an intermediate at some appropriate stage of synthesis, or by resolving a compound of formula I.

35 Synthesis of Compounds

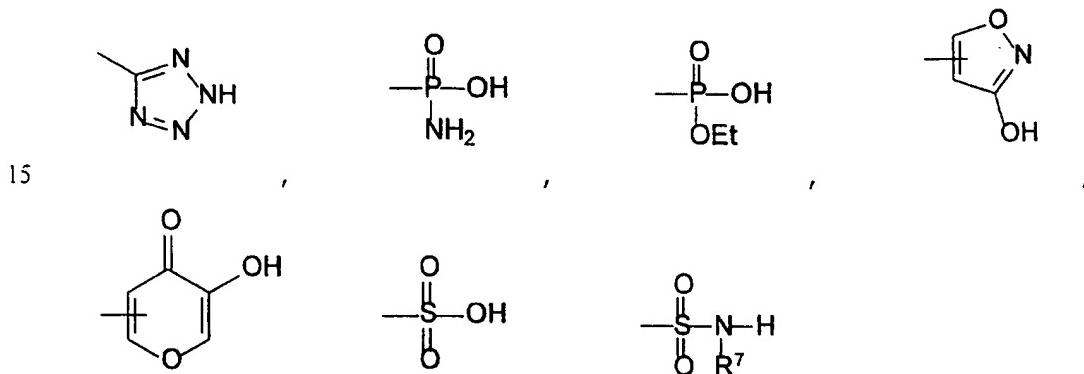

Many non-carboxamide PARP inhibitors can be synthesized by known methods from starting materials that are known, are themselves commercially available, or may be prepared by methods used to prepare corresponding compounds in the 40 literature. See, for example, Suto et al., "Dihydroisoquinolinones: The Design and Synthesis of a New Series of Potent Inhibitors of Poly(ADP-ribose) Polymerase",

Anticancer Drug Des., 6:107-17 (1991), which discloses processes for synthesizing a number of different PARP inhibitors.

The compounds of the present invention can also be prepared by using the general synthetic pathway depicted below. A compound of formula I may be prepared by contacting an intermediate of formula III:

wherein R₁, R₂, R₃, R₄, R₅ and Y are as defined above for compounds of formula I of the invention; and "halo" is a chloro, bromo or iodo moiety; with a -COOR₅ radical or a substituted or unsubstituted radical selected from the group consisting of the following carboxylic acid mimics:

and , wherein R' is hydrogen, alkyl, alkenyl, cycloalkyl or cycloalkenyl, itself either unsubstituted or substituted with an alkyl, alkenyl, cycloalkyl or cycloalkenyl group. The intermediate of formula III can be prepared by methods known in the art.

Typically, the reaction shown above takes place in a solvent inert with respect to the intermediate of formula III. Typical solvents include, for example, tetrahydrofuran

("THF"), methylene chloride, chloroform, lower alkanols, dimethylformamide, and a wide variety of other inert organic solvents.

The above-described reaction can take place at varying 5 temperatures depending, for example, upon the solvent used, the solubility of the intermediate of formula III in the solvent being used, and the susceptibility of the reactions to oxidize or participate in side reactions. Preferably, however, when the above reaction is used, it takes place at 10 a temperature from about -100°C to about room temperature, preferably from about -80°C to about -0°C.

The time required for the above reaction also can vary widely, depending on much the same factors. Typically, however, the reaction takes within a time of about 5 minutes 15 to about 24 hours, preferably from about 10 minutes to an hour.

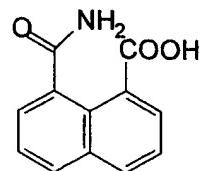

Preferably, the above reaction takes place in the presence of a halo-removal compound that will provide an attractive cation for extraction of the halo anion, such as 20 n-butyllithium. The addition sequence of the intermediate of formula III, the halo-removal compound, a solvent (if used), and the -COOR⁵ or acid mimic radical, can vary significantly depending upon the relative reactivities of these materials, the purity of these materials, the temperature at which the 25 reaction is performed, the degree of agitation used in the reaction, and the like. Preferably, however, the intermediate of formula III is first dissolved in a solvent, the halo-removal compound is first added, and the -COOR⁵ or acid mimic radical is then added.

30 The product, a compound of formula I, is isolated from the reaction mixture by conventional techniques, such as by precipitating out, extraction with an immiscible solvent under appropriate pH conditions, evaporation, filtration, crystallization and the like. Typically, however, the 35 product is removed by acidifying the reaction mixture under aqueous conditions and collecting the precipitated solid

material.

Other variations and modifications of this invention using the synthetic pathway described above will be obvious to those skilled in the art.

5 In addition, compounds related to 8-carboxy-naphthalene-1-carboxamide (also known as 8-carbamoyl-naphthalene carboxylic acid), shown below:

can be prepared by known chemical syntheses such as, for 10 example, that described in *Gazz. Chim. Ital.*, 79:603-605 (1949). Moreover, the particular compound shown above is commercially available from Lancaster Synthesis Inc., P.O. Box 1000, Windham, NH 03087, USA.

Typically, the compounds of formula I used in the 15 composition of the invention will have an IC₅₀ for inhibiting poly(ADP-ribose) polymerase in vitro of 100 µM or lower, preferably 25 µM or lower, more preferably 12 µM or lower and, even more preferably, 12 mM or lower.

20 Pharmaceutical Compositions

A further aspect of the present invention is directed to a pharmaceutical composition comprising a pharmaceutically acceptable carrier or a diluent and a therapeutically effective amount of a compound of formula I or a 25 pharmaceutically acceptable salt, hydrate, ester, solvate, prodrug, metabolite, stereoisomer, or mixtures (hereafter, "a compound of formula I").

The formula I compounds of the invention are useful in the manufacture of pharmaceutical formulations comprising an 30 effective amount thereof in conjunction with or as an admixture with excipients or carriers suitable for either enteral or parenteral application. As such, formulations of

the present invention suitable for oral administration may be in the form of discrete units such as capsules, cachets, tablets, troche or lozenges, each containing a predetermined amount of the active ingredient; in the form of a powder or 5 granules; in the form of a solution or a suspension in an aqueous liquid or nonaqueous liquid; or in the form of an oil-in-water emulsion or a water-in-oil emulsion. The active ingredient may also be in the form of a bolus, electuary, or paste.

10 The composition will usually be formulated into a unit dosage form, such as a tablet, capsule, aqueous suspension or solution. Such formulations typically include a solid, semisolid, or liquid carrier. Exemplary carriers include lactose, dextrose, sucrose, sorbitol, mannitol, starches, gum 15 acacia, calcium phosphate, mineral oil, cocoa butter, oil of theobroma, alginates, tragacanth, gelatin, syrup, methyl cellulose, polyoxyethylene sorbitan monolaurate, methyl hydroxybenzoate, propyl hydroxybenzoate, talc, magnesium stearate, and the like.

20 Particularly preferred formulations include tablets and gelatin capsules comprising the active ingredient together with (a) diluents, such as lactose, dextrose, sucrose, mannitol, sorbitol, cellulose, dried corn starch, and glycine; and/or (b) lubricants, such as silica, talcum, 25 stearic acid, its magnesium or calcium salt, and polyethylene glycol.

Tablets may also contain binders, such as magnesium aluminum silicate, starch paste, gelatin, tragacanth, methylcellulose, sodium carboxymethylcellulose and 30 polyvinylpyrrolidone; carriers, such as lactose and corn starch; disintegrants, such as starches, agar, alginic acid or its sodium salt, and effervescent mixtures; and/or absorbents, colorants, flavors, and sweeteners. The compositions of the invention may be sterilized and/or 35 contain adjuvants, such as preserving, stabilizing, swelling or emulsifying agents, solution promoters, salts for

regulating osmotic pressure, and/or buffers. In addition, the composition may also contain other therapeutically valuable substances. Aqueous suspensions may contain emulsifying and suspending agents combined with the active 5 ingredient. All oral dosage forms may further contain sweetening and/or flavoring and/or coloring agents.

These compositions are prepared according to conventional mixing, granulating, or coating methods, respectively, and contain about 0.1 to 75% of the active 10 ingredient, preferably about 1 to 50% of the same. A tablet may be made by compressing or molding the active ingredient optionally with one or more accessory ingredients. Compressed tablets may be prepared by compressing, in a suitable machine, the active ingredient in a free-flowing 15 form such as a powder or granules, optionally mixed with a binder, lubricant, inert diluent, surface active, or dispersing agent. Molded tablets may be made by molding, in a suitable machine, a mixture of the powdered active ingredient and a suitable carrier moistened with an inert 20 liquid diluent.

When administered parenterally, the composition will normally be in a unit dosage, sterile injectable form (aqueous isotonic solution, suspension or emulsion) with a pharmaceutically acceptable carrier. Such carriers are 25 preferably non-toxic, parenterally-acceptable and contain non-therapeutic diluents or solvents. Examples of such carriers include water; aqueous solutions, such as saline (isotonic sodium chloride solution), Ringer's solution, dextrose solution, and Hanks' solution; and nonaqueous 30 carriers, such as 1,3-butanediol, fixed oils (e.g., corn, cottonseed, peanut, sesame oil, and synthetic mono- or di-glyceride), ethyl oleate, and isopropyl myristate.

Oleaginous suspensions can be formulated according to techniques known in the art using suitable dispersing or 35 wetting agents and suspending agents. Among the acceptable solvents or suspending mediums are sterile fixed oils. For

this purpose, any bland fixed oil may be used. Fatty acids, such as oleic acid and its glyceride derivatives, including olive oil and castor oil, especially in their polyoxyethylated forms, are also useful in the preparation of 5 injectables. These oil solutions or suspensions may also contain long-chain alcohol diluents or dispersants.

Sterile saline is a preferred carrier, and the compounds are often sufficiently water soluble to be made up as a solution for all foreseeable needs. The carrier may contain 10 minor amounts of additives, such as substances that enhance solubility, isotonicity, and chemical stability, e.g., anti-oxidants, buffers and preservatives.

When administered rectally, the composition will usually be formulated into a unit dosage form such as a suppository 15 or cachet. These compositions can be prepared by mixing the compound with suitable non-irritating excipients that are solid at room temperature, but liquid at rectal temperature, such that they will melt in the rectum to release the compound. Common excipients include cocoa butter, beeswax 20 and polyethylene glycols or other fatty emulsions or suspensions.

Moreover, the compounds may be administered topically, especially when the conditions addressed for treatment involve areas or organs readily accessible by topical 25 application, including neurological disorders of the eye, the skin or the lower intestinal tract.

For topical application to the eye, or ophthalmic use, the compounds can be formulated as micronized suspensions in isotonic, pH-adjusted sterile saline or, preferably, as a 30 solution in isotonic, pH-adjusted sterile saline, either with or without a preservative such as benzylalkonium chloride. Alternatively, the compounds may be formulated into ointments, such as petrolatum.

For topical application to the skin, the compounds can 35 be formulated into suitable ointments containing the compounds suspended or dissolved in, for example, mixtures

with one or more of the following: mineral oil, liquid petrolatum, white petrolatum, propylene glycol, polyoxyethylene compound, polyoxypropylene compound, emulsifying wax and water. Alternatively, the compounds can 5 be formulated into suitable lotions or creams containing the active compound suspended or dissolved in, for example, a mixture of one or more of the following: mineral oil, sorbitan monostearate, polysorbate 60, cetyl ester wax, cetearyl alcohol, 2-octyldodecanol, benzyl alcohol and water.

10 Topical application to the lower intestinal tract can be effected in rectal suppository formulations (see above) or in suitable enema formulations.

Formulations suitable for nasal or buccal administration, (such as self-propelling powder dispensing 15 formulations), may comprise about 0.1% to about 5% w/w of the active ingredient or, for example, about 1% w/w of the same. In addition, some formulations can be compounded into a sublingual troche or lozenge.

The formulations may conveniently be presented in unit 20 dosage form and may be prepared by any of the methods well known in the art of pharmacy. All methods include the step of bringing the active ingredient into association with the carrier which constitutes one or more accessory ingredients. In general, the formulations are prepared by uniformly and 25 intimately bringing the active ingredient into association with a liquid carrier or a finely divided solid carrier or both, and then, if necessary, shaping the product into the desired formulation.

In a preferred embodiment, the carrier is a 30 biodegradable polymer or mixture of biodegradable polymers with appropriate time release characteristics and release kinetics suitable for providing efficacious concentrations of the compounds of the invention over a prolonged period of time without the need for frequent re-dosing. The 35 composition of the present invention can be incorporated into the biodegradable polymer or polymer mixture in any suitable

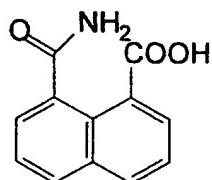

manner known to one of ordinary skill in the art and may form a homogeneous matrix with the biodegradable polymer, or may be encapsulated in some way within the polymer, or may be molded into a solid implant. In one embodiment, the 5 biodegradable polymer or polymer mixture is used to form a soft "depot" containing the pharmaceutical composition of the present invention that can be administered as a flowable liquid, for example, by injection, but which remains sufficiently viscous to maintain the pharmaceutical 10 composition within the localized area around the injection site. The degradation time of the depot so formed can be varied from several days to a few years, depending upon the polymer selected and its molecular weight. By using a polymer composition in injectable form, even the need to make an 15 incision may be eliminated. In any event, a flexible or flowable delivery "depot" will adjust to the shape of the space it occupies with the body with a minimum of trauma to surrounding tissues. The pharmaceutical composition of the present invention is used in amounts that are therapeutically 20 effective, and may depend upon the desired release profile, the concentration of the pharmaceutical composition required for the sensitizing effect, and the length of time that the pharmaceutical composition has to be released for treatment.

The composition of the invention is preferably 25 administered as a capsule or tablet containing a single or divided dose of the compound, or as a sterile solution, suspension, or emulsion, for parenteral administration in a single or divided dose.

In another preferred embodiment, the compounds of the 30 invention can be prepared in lyophilized form. In this case, 1 to 100 mg of a PARP inhibitor may be lyophilized in individual vials, together with a carrier and a buffer, such as mannitol and sodium phosphate. The composition may then be reconstituted in the vials with bacteriostatic water 35 before administration.

In the compositions and methods of the invention, a

preferred embodiment is when, in the compound of formula I, Y is a fused, 6-membered, aromatic carbocyclic ring, R₁, R₂, R₃, and R₄ are each hydrogen, and X is a -COOH group. A compound defined by the foregoing sentence is 8-5 carboxynaphthalene-1-carboxamide, which has the following structure:

The compounds of the invention are used in the composition in amounts that are therapeutically effective. 10 While the effective amount of the PARP inhibitor will depend upon the particular compound being used, amounts of the these compounds varying from about 1% to about 65% have been easily incorporated into liquid or solid carrier delivery systems.

15 Compositions and Methods for Effecting Neuronal Activity

Preferably, according to the invention, an effective therapeutic amount of the compounds and compositions described above are administered to animals to effect a neuronal activity, preferably one that is not mediated by 20 NMDA neurotoxicity. Such neuronal activity may consist of stimulation of damaged neurons, promotion of neuronal regeneration, prevention of neurodegeneration and treatment of a neurological disorder. Accordingly, the present invention further relates to a method of effecting a neuronal 25 activity in an animal, comprising administering an effective amount of the compound of formula I to said animal. Further, the compounds of the invention inhibit PARP activity and, thus, are believed to be useful for treating neural tissue damage, particularly damage resulting from cerebral ischemia 30 and reperfusion injury or neurodegenerative diseases in mammals.

Examples of neurological disorders that are treatable by

the method of using the present invention include, without limitation, trigeminal neuralgia; glossopharyngeal neuralgia; Bell's Palsy; myasthenia gravis; muscular dystrophy; amyotrophic lateral sclerosis; progressive muscular atrophy; 5 progressive bulbar inherited muscular atrophy; herniated, ruptured or prolapsed invertebrate disk syndromes; cervical spondylosis; plexus disorders; thoracic outlet destruction syndromes; peripheral neuropathies such as those caused by lead, dapsone, ticks, porphyria, or Guillain-Barré syndrome; 10 Alzheimer's disease; Huntington's Disease and Parkinson's disease.

The method of the present invention is particularly useful for treating a neurological disorder selected from the group consisting of: peripheral neuropathy caused by physical 15 injury or disease state; head trauma, such as traumatic brain injury; physical damage to the spinal cord; stroke associated with brain damage, such as vascular stroke associated with hypoxia and brain damage, focal cerebral ischemia, global cerebral ischemia, and cerebral reperfusion injury; 20 demyelinating diseases, such as multiple sclerosis; and neurological disorders related to neurodegeneration, such as Alzheimer's Disease, Parkinson's Disease, Huntington's Disease and amyotrophic lateral sclerosis (ALS).

25 Treating Other PARP-Related Disorders

The compounds, compositions and methods of the present invention are particularly useful for treating or preventing tissue damage resulting from cell death or damage due to necrosis or apoptosis.

30 The compounds, compositions and methods of the invention can also be used to treat a cardiovascular disorder in an animal, by administering an effective amount of the compound of formula to the animal.

As used herein, the term "cardiovascular disorders" 35 refers to those disorders that can either cause ischemia or are caused by reperfusion of the heart. Examples include,

but are not limited to, coronary artery disease, angina pectoris, myocardial infarction, cardiovascular tissue damage caused by cardiac arrest, cardiovascular tissue damage caused by cardiac bypass, cardiogenic shock, and related conditions 5 that would be known by those of ordinary skill in the art or which involve dysfunction of or tissue damage to the heart or vasculature, especially, but not limited to, tissue damage related to PARP activation.

For example, the methods of the invention are believed 10 to be useful for treating cardiac tissue damage, particularly damage resulting from cardiac ischemia or caused by reperfusion injury in animals. The methods of the invention are particularly useful for treating cardiovascular disorders selected from the group consisting of: coronary artery 15 disease, such as atherosclerosis; angina pectoris; myocardial infarction; myocardial ischemia and cardiac arrest; cardiac bypass; and cardiogenic shock. The methods of the invention are particularly helpful in treating the acute forms of the above cardiovascular disorders.

20 Further, the methods of the invention can be used to treat tissue damage resulting from cell damage or death due to necrosis or apoptosis, neural tissue damage resulting from ischemia and reperfusion injury, neurological disorders and neurodegenerative diseases; to prevent or treat vascular 25 stroke; to treat or prevent cardiovascular disorders; to treat other conditions and/or disorders such as age-related macular degeneration, AIDS and other immune senescence diseases, arthritis, atherosclerosis, cachexia, cancer, degenerative diseases of skeletal muscle involving 30 replicative senescence, diabetes, head trauma, immune senescence, inflammatory bowel disorders (such as colitis and Crohn's disease), muscular dystrophy, osteoarthritis, osteoporosis, chronic and/or acute pain (such as neuropathic pain), renal failure, retinal ischemia, septic shock (such as 35 endotoxic shock), and skin aging; to extend the lifespan and proliferative capacity of cells; to alter gene expression of

senescent cells; or to radiosensitize tumor cells

Further still, the methods of the invention can be used to treat cancer and to radiosensitize tumor cells. The term "cancer" is interpreted broadly. The compounds of the present invention can be "anti-cancer agents", which term also encompasses "anti-tumor cell growth agents" and "anti-neoplastic agents". For example, the methods of the invention are useful for treating cancers and radiosensitizing tumor cells in cancers such as ACTH-producing tumors, acute lymphocytic leukemia, acute nonlymphocytic leukemia, cancer of the adrenal cortex, bladder cancer, brain cancer, breast cancer, cervical cancer, chronic lymphocytic leukemia, chronic myelocytic leukemia, colorectal cancer, cutaneous T-cell lymphoma, endometrial cancer, esophageal cancer, Ewing's sarcoma, gallbladder cancer, hairy cell leukemia, head & neck cancer, Hodgkin's lymphoma, Kaposi's sarcoma, kidney cancer, liver cancer, lung cancer (small and/or non-small cell), malignant peritoneal effusion, malignant pleural effusion, melanoma, mesothelioma, multiple myeloma, neuroblastoma, non-Hodgkin's lymphoma, osteosarcoma, ovarian cancer, ovary (germ cell) cancer, prostate cancer, pancreatic cancer, penile cancer, retinoblastoma, skin cancer, soft-tissue sarcoma, squamous cell carcinomas, stomach cancer, testicular cancer, thyroid cancer, trophoblastic neoplasms, uterine cancer, vaginal cancer, cancer of the vulva and Wilm's tumor.

The term "radiosensitizer", as used herein, is defined as a molecule, preferably a low molecular weight molecule, administered to animals in therapeutically effective amounts to increase the sensitivity of the cells to be radiosensitized to electromagnetic radiation and/or to promote the treatment of diseases which are treatable with electromagnetic radiation. Diseases which are treatable with electromagnetic radiation include neoplastic diseases, benign and malignant tumors, and cancerous cells. Electromagnetic radiation treatment of other diseases not listed herein are

also contemplated by the present invention.. The terms "electromagnetic radiation" and "radiation" as used herein includes, but is not limited to, radiation having the wavelength of 10^{-20} to 10^5 meters. Preferred embodiments of 5 the present invention employ the electromagnetic radiation of: gamma-radiation (10^{-22} to 10^{-13} m) x-ray radiation (10^{-11} to 10^{-9} m), ultraviolet light (10 nm to 400 nm), visible light (400 nm to 700 nm), infrared radiation (700 nm to 1.0 mm), and microwave radiation (1 mm to 30 cm).

10 Radiosensitizers are known to increase the sensitivity of cancerous cells to the toxic effects of electromagnetic radiation. Several mechanisms for the mode of action of radiosensitizers have been suggested in the literature including: hypoxic cell radiosensitizers (e.g., 2-15 nitroimidazole compounds, and benzotriazine dioxide compounds) promote the reoxygenation of hypoxic tissue and/or catalyze the generation of damaging oxygen radicals; non-hypoxic cell radiosensitizers (e.g., halogenated pyrimidines) can be analogs of DNA bases and preferentially incorporate 20 into the DNA of cancer cells and thereby promote the radiation-induced breaking of DNA molecules and/or prevent the normal DNA repair mechanisms; and various other potential mechanisms of action have been hypothesized for radiosensitizers in the treatment of disease.

25 Many cancer treatment protocols currently employ radiosensitizers activated by the electromagnetic radiation of x-rays. Examples of x-ray activated radiosensitizers include, but are not limited to, the following: metronidazole, misonidazole, desmethylmisonidazole, 30 pimonidazole, etanidazole, nimorazole, mitomycin C, RSU 1069, SR 4233, E09, RB 6145, nicotinamide, 5-bromodeoxyuridine (BUdR), 5-iododeoxyuridine (IUDR), bromodeoxycytidine, fluorodeoxyuridine (FudR), hydroxyurea, cisplatin, and therapeutically effective analogs and derivatives of the 35 same.

Photodynamic therapy (PDT) of cancers employs visible

light as the radiation activator of the sensitizing agent. Examples of photodynamic radiosensitizers include the following, but are not limited to: hematoporphyrin derivatives, Photofrin, benzoporphyrin derivatives, NPe6, tin etioporphyrin SnET2, pheoborbide-a, bacteriochlorophyll-a, naphthalocyanines, phthalocyanines, zinc phthalocyanine, and therapeutically effective analogs and derivatives of the same.

Radiosensitizers may be administered in conjunction with a therapeutically effective amount of one or more other compounds, including but not limited to: compounds which promote the incorporation of radiosensitizers to the target cells; compounds which control the flow of therapeutics, nutrients, and/or oxygen to the target cells; chemotherapeutic agents which act on the tumor with or without additional radiation; or other therapeutically effective compounds for treating cancer or other disease. Examples of additional therapeutic agents that may be used in conjunction with radiosensitizers include, but are not limited to: 5-fluorouracil, leucovorin, 5'-amino-5'deoxythymidine, oxygen, carbogen, red cell transfusions, perfluorocarbons (e.g., Fluosol-DA), 2,3-DPG, BW12C, calcium channel blockers, pentoxyfylline, antiangiogenesis compounds, hydralazine, and L-BSO. Examples of chemotherapeutic agents that may be used in conjunction with radiosensitizers include, but are not limited to: adriamycin, camptothecin, carboplatin, cisplatin, daunorubicin, docetaxel, doxorubicin, interferon (alpha, beta, gamma), interleukin 2, irinotecan, paclitaxel, topotecan, and therapeutically effective analogs and derivatives of the same.

The compounds of the present invention may also be used for radiosensitizing tumor cells.

The term "treating" refers to:

(i) preventing a disease, disorder or condition from occurring in an animal that may be predisposed to the disease, disorder and/or condition, but has not yet been

diagnosed as having it;

(ii) inhibiting the disease, disorder or condition, i.e., arresting its development; and

(iii) relieving the disease, disorder or condition, 5 i.e., causing regression of the disease, disorder and/or condition.

Administration

For medical use, the amount required of a compound of 10 formula I to achieve a therapeutic effect will vary according to the particular compound administered, the route of administration, the mammal under treatment, and the particular disorder or disease concerned. A suitable systemic dose of a compound of formula I for a mammal 15 suffering from, or likely to suffer from, any condition as described herein is typically in the range of about 0.1 to about 100 mg of base per kilogram of body weight, preferably from about 1 to about 10 mg/kg of mammal body weight. It is understood that the ordinarily skilled physician or 20 veterinarian will readily be able to determine and prescribe the amount of the compound effective for the desired prophylactic or therapeutic treatment.

In so proceeding, the physician or veterinarian may employ an intravenous bolus followed by an intravenous 25 infusion and repeated administrations, as considered appropriate. In the methods of the present invention, the compounds may be administered, for example, orally, parenterally, by inhalation spray, topically, rectally, nasally, buccally, sublingually, vaginally, 30 intraventricularly, or via an implanted reservoir in dosage formulations containing conventional non-toxic pharmaceutically-acceptable carriers, adjuvants and vehicles.

Parenteral includes, but is not limited to, the following examples of administration: intravenous, 35 subcutaneous, intramuscular, intraspinal, intraosseous, intraperitoneal, intrathecal, intraventricular, intrasternal

or intracranial injection and infusion techniques, such as by subdural pump. Invasive techniques are preferred, particularly direct administration to damaged neuronal tissue. While it is possible for the compound of formula I 5 to be administered alone, it is preferable to provide it as a part of a pharmaceutical formulation.

To be effective therapeutically as central nervous system targets, the compounds used in the methods of the present invention should readily penetrate the blood-brain 10 barrier when peripherally administered. Compounds which cannot penetrate the blood-brain barrier, however, can still be effectively administered by an intraventricular route.

The compounds used in the methods of the present invention may be administered by a single dose, multiple 15 discrete doses or continuous infusion. Since the compounds are small, easily diffusible and relatively stable, they are well suited to continuous infusion. Pump means, particularly subcutaneous or subdural pump means, are preferred for continuous infusion.

20 For the methods of the present invention, any effective administration regimen regulating the timing and sequence of doses may be used. Doses of the compounds preferably include pharmaceutical dosage units comprising an efficacious quantity of active compound. By an efficacious quantity is 25 meant a quantity sufficient to inhibit PARP activity and/or derive the desired beneficial effects therefrom through administration of one or more of the pharmaceutical dosage units. In a particularly preferred embodiment, the dose is sufficient to prevent or reduce the effects of vascular 30 stroke or other neurodegenerative diseases.

An exemplary daily dosage unit for a vertebrate host comprises an amount of from about 0.001 mg/kg to about 50 mg/kg. Typically, dosage levels on the order of about 0.1 mg to about 10,000 mg of the active ingredient compound are 35 useful in the treatment of the above conditions, with preferred levels being about 0.1 mg to about 1,000 mg. The

specific dose level for any particular patient will vary depending upon a variety of factors, including the activity of the specific compound employed; the age, body weight, general health, sex, and diet of the patient; the time of administration; the rate of excretion; any combination of the compound with other drugs; the severity of the particular disease being treated; and the form and route of administration. Typically, in vitro dosage-effect results provide useful guidance on the proper doses for patient administration. Studies in animal models can also be helpful. The considerations for determining the proper dose levels are well-known in the art.

In methods of treating nervous insult (particularly acute ischemic stroke and global ischemia caused by drowning or head trauma), the compounds of the invention can be co-administered with one or more other therapeutic agents, preferably agents which can reduce the risk of stroke (such as aspirin) and, more preferably, agents which can reduce the risk of a second ischemic event (such as ticlopidine).

The compounds and compositions can be co-administered with one or more therapeutic agents either (i) together in a single formulation, or (ii) separately in individual formulations designed for optimal release rates of their respective active agent. Each formulation may contain from about 0.01% to about 99.99% by weight, preferably from about 3.5% to about 60% by weight, of the compound of the invention, as well as one or more pharmaceutical excipients, such as wetting, emulsifying and pH buffering agents. When the compounds used in the methods of the invention are administered in combination with one or more other therapeutic agents, specific dose levels for those agents will depend upon considerations such as those identified above for compositions and methods of the invention in general.

For example, Table II below provides known median dosages for selected chemotherapeutic agents that may be

administered in combination with the compounds of the invention to such diseases or various cancers.

TABLE II

	CHEMOTHERAPEUTIC AGENT	MEDIAN DOSAGE
5	Asparaginase	10,000 units
	Bleomycin Sulfate	15 units
	Carboplatin	50-450 mg
	Carmustine	100 mg
	Cisplatin	10-50 mg
10	Cladribine	10 mg
	Cyclophosphamide (lyophilized)	100 mg to 2 gm
	Cyclophosphamide (non-lyophilized)	100 mg to 2 gm
	Cytarabine (lyophilized powder)	100 mg to 2 gm
	Dacarbazine	100-200 mg
15	Dactinomycin	0.5 mg
	Daunorubicin	20 mg
	Diethylstilbestrol	250 mg
	Doxorubicin	10-150 mg
	Etidronate	300 mg
20	Etoposide	100 mg
	Floxuridine	500 mg
	Fludarabine Phosphate	50 mg
	Fluorouracil	500 mg to 5 gm
	Goserelin	3.6 mg
25	Granisetron Hydrochloride	1 mg
	Idarubicin	5-10 mg
	Ifosfamide	1-3 gm
	Leucovorin Calcium	50-350 mg
	Leuprolide	3.75-7.5 mg
30	Mechlorethamine	10 mg
	Medroxyprogesterone	1 gm
	Melphalan	50 gm
	Methotrexate	20 mg to 1 gm

	CHEMOTHERAPEUTIC AGENT	MEDIAN DOSAGE
	Mitomycin	5-40 mg
	Mitoxantrone	20-30 mg
	Ondansetron Hydrochloride	40 mg
	Paclitaxel	30 mg
5	Pamidronate Disodium	30-90 mg
	Pegaspargase	750 units
	Plicamycin	2,500 mcgm
	Streptozocin	1 gm
	Thiotepa	15 mg
10	Teniposide	50 mg
	Vinblastine	10 mg
	Vincristine	1-5 mg
	Aldesleukin	22 million units
	Epoetin Alfa	2,000-10,000 units
15	Filgrastim	300-480 mcgm
	Immune Globulin	500 mg to 10 gm
	Interferon Alpha-2a	3-36 million units
	Interferon Alpha-2b	3-50 million units
	Levamisole	50 mg
20	Octreotide	1,000-5,000 mcgm
	Sargramostim	250-500 mcgm

For the methods of the present invention, any administration regimen regulating the timing and sequence of delivery of the compound can be used and repeated as necessary to effect treatment. Such regimen may include pretreatment and/or co-administration with additional therapeutic agents.

To maximize protection of nervous tissue from nervous insult, the compounds of the invention should be administered to the affected cells as soon as possible. In situations where nervous insult is anticipated, the compounds are advantageously administered before the expected nervous

insult. Such situations of increased likelihood of nervous insult include surgery, such as carotid endarterectomy, cardiac, vascular, aortic, orthopedic surgery; endovascular procedures, such as arterial catheterization (carotid, 5 vertebral, aortic, cardia, renal, spinal, Adamkiewicz); injections of embolic agents; the use of coils or balloons for hemostasis; interruptions of vascularity for treatment of brain lesions; and predisposing medical conditions such as crescendo transient ischemic attacks, emboli and sequential 10 strokes.

Where pre-treatment for stroke or ischemia is impossible or impracticable, it is important to bring the compounds of the invention into contact with the affected cells as soon as possible, either during or after the event. In the time 15 period between strokes, however, diagnosis and treatment procedures should be minimized to save the cells from further damage and death. Therefore, a particularly advantageous mode of administration with a patient diagnosed with acute multiple vascular strokes is by implantation of a subdural 20 pump to deliver the compound(s) of the invention directly to the infarct area of the brain. Even if comatose, it is expected that the patient would recover more quickly than he or she would without this treatment. Moreover, in any conscious state of the patient, it is expected that any 25 residual neurological symptoms, as well as the re-occurrence of stroke, would be reduced.

As to patients diagnosed with other acute disorders believed to be related to PARP activity, such as diabetes, arthritis and Crohn's disease, the compound of the invention 30 should also be administered as soon as possible in a single or divided dose.

Depending on the patient's presenting symptoms and the degree of response to the initial administration of the compound of the invention, the patient may further receive 35 additional doses of the same or different compounds of the invention, by one of the following routes: parenterally,

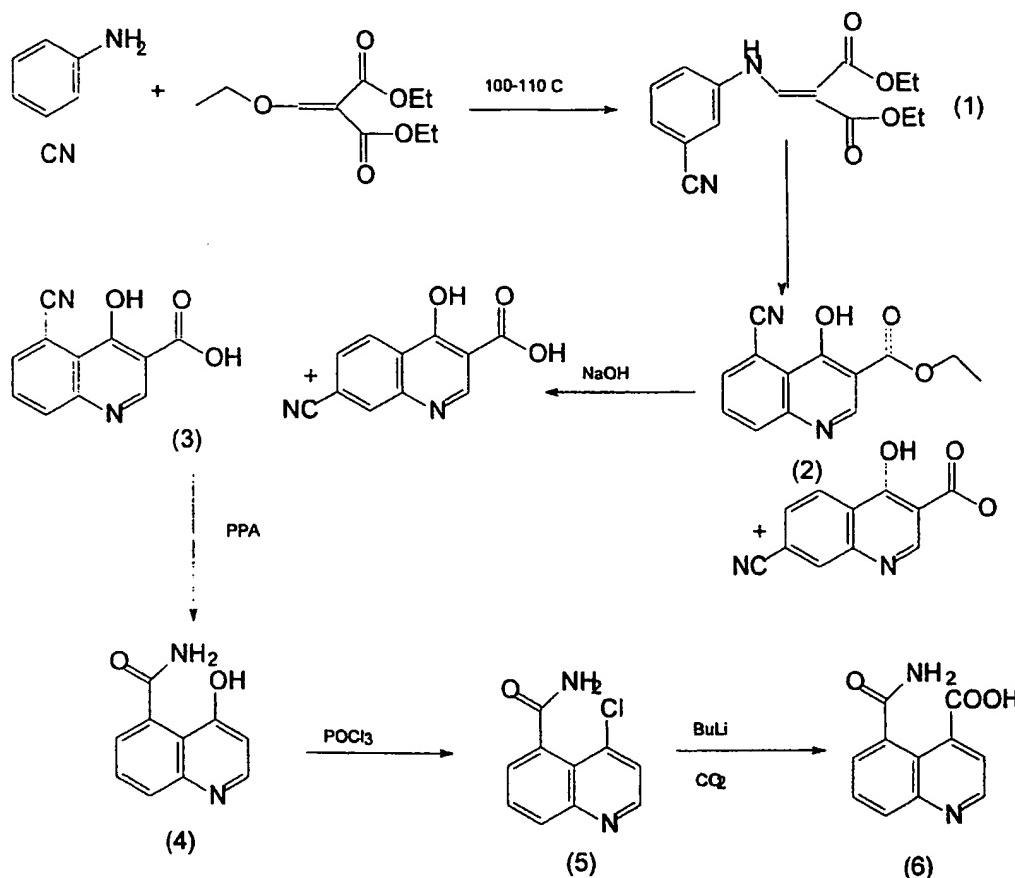

such as by injection or by intravenous administration; orally, such as by capsule or tablet; by implantation of a biocompatible, biodegradable polymeric matrix delivery system comprising the compound; or by direct administration to the 5 infarct area by insertion of a subdural pump or a central line. It is expected that the treatment would alleviate the disorder, either in part or in its entirety and that fewer further occurrences of the disorder would develop. It also is expected that the patient would suffer fewer residual 10 symptoms.

Where a patient is diagnosed with an acute disorder prior to the availability of the compounds of the invention, the patient's condition may deteriorate due to the acute disorder and become a chronic disorder by the time that the 15 compounds are available. Even when a patient receives a compound of formula I for the chronic disorder, it is also expected that the patient's condition would stabilize and actually improve as a result of receiving the compound. The compounds of the present invention may also be used to 20 prevent disorders by prophylactic administration of the compounds of the present invention.

EXAMPLES

The following examples are illustrative of preferred 25 embodiments of inventions and are not to be construed as limiting the present invention thereto. All polymer molecular weights are mean average molecular weights. All percentages are based on the percent by weight of the final delivery system or formulation prepared unless otherwise 30 indicated, and all totals equal 100% by weight.

Example 1: Preparation of 5-Carbamoylquinoline-4-Carboxylic Acid

A mixture of m-cyanoaniline (1.0 g, 8.46 mmol) and diethylethoxyethylene malonate (1.97 g, 9.13 mmol) was stirred at 100-110°C for one hour to form a homogenous solution. The solution was cooled to room temperature, and pale yellowish crystals were formed. The crystals were collected and washed with hexane, giving 2.33 g (yield 100%) of ethyl- α -carbethoxy- β -(m-cyanoanilino)acrylate (1), mp 109-111°C.

The acrylate ester (1) was added through the top of an air condenser in portions to boiling diphenyl ether (10 ml). After a few minutes of addition, crystals formed. The resulting mixture was heated at the same temperature for 30 minutes and then cooled to room temperature. The crystals were collected and washed with hexane, to give 1.79 g of the regioisomer esters (2) (yield 89.5%), mp 305-307°C (dec.).

The esters (2) (1.79 g, 7.39 mmol) were suspended in 10%

NaOH (15 ml), and the mixture was heated to reflux for one hour and cooled. Decolorizing charcoal (1.0 g) was added, and the mixture was heated to reflux for an additional 10 minutes. The solid was removed, and the filtrate was 5 acidified to pH 5 with 10% HCl. A cream precipitate was collected, washed with water and hexane, and dried to give the acid isomer mixtures (3), 1.63 g (yield 100%), mp>320°C.

The acids (3) (0.5 g, 2.33 mmol) were added to pre-heated polyphosphoric acid (PPA) (2.2 g) in portions over a 10 period of about 8 minutes with stirring at 255-265°C. The mixture was heated at the same temperature for 20 minutes, cooled to room temperature, and then poured into ice-water. An undesired precipitate, 0.259 g of 7-aminocarbonyl-4-hydroxyisoquinoline, was formed, collected and washed with 15 water (yield 59.1%). The remaining aqueous solution was adjusted to pH 5-6 with NaHCO₃ solution to precipitate out 138 mg of 4-hydroxyquinoline-5-carboxamide (4) (yield 31.5%), mp>250°C.

Compound (4) (1.0 g, 5.88 mmol) was suspended in POCl₃, 20 and the resulting mixture was heated to a temperature of 130°C (bath temperature). After 10 minutes, the suspension became a dark solution, and gases were vigorously released. After one hour and forty-five minutes, the reaction was complete, as shown by thin layer chromatography. The reaction mixture 25 was cooled to room temperature, poured into ice water and basified with 10% NaOH to pH 9. A pale purple precipitate was formed, collected and washed with water. The solid was dissolved in MeOH and decolorized with activated carbon. The solid was removed and the remaining filtrate was evaporated 30 under a vacuum to afford 300 mg (yield 25%) of a white crystalline powder, 4-hydroxyquinoline-5-carboxamide (5), mp 205-207°C.

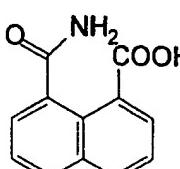

n-Butyllithium (3.88 mmol) in hexane was added slowly to a solution of 4-hydroxyquinoline-5-carboxamide (5) (400 mg, 35 1.94 mmol) in THF (10 ml) at a temperature of -78°C. Next, dry CO₂ gas was bubbled into the mixture for 15 minutes at -

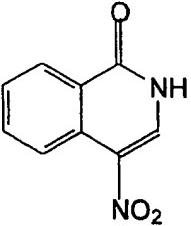

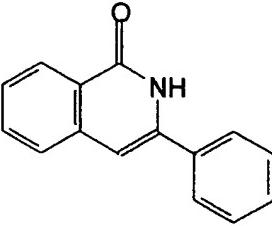

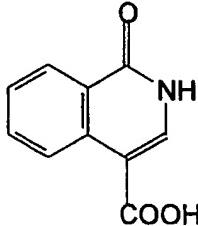

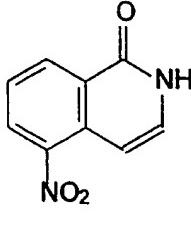

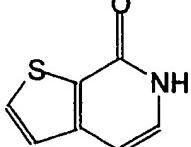

78°C. Saturated NH₄Cl solution (20 ml) was also added. The mixture was warmed to room temperature, concentrated, and the remaining residue was dissolved in a saturated Na₂CO₃ solution. The resulting aqueous solution was washed with 5 ether and then acidified to pH 6 with 1N HCl to afford 124 mg of the product compound (6) as a solid.

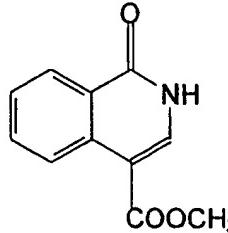

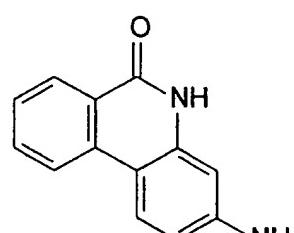

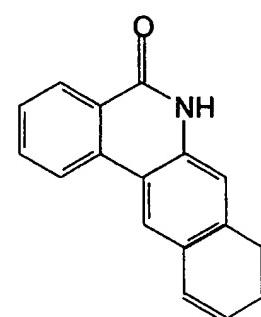

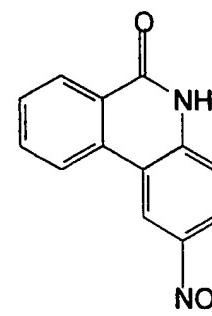

Example 2: Approximate IC₅₀ Data for Selected Compounds

The IC₅₀ of with respect to PARP inhibition was 10 determined for several compounds by a PARP assay using purified recombinant human PARP from Trevigen (Gaithersburg, MD), as follows: The PARP enzyme assay was set up on ice in a volume of 100 microliters consisting of 10 mM Tris-HCl (pH 8.0), 1 mM MgCl₂, 28 mM KCl, 28 mM NaCl, 0.1 mg/ml of herring 15 sperm DNA (activated as a 1 mg/ml stock for 10 minutes in a 0.15% hydrogen peroxide solution), 3.0 micromolar [3H]nicotinamide adenine dinucleotide (470 mci/mmol), 7 micrograms/ml PARP enzyme, and various concentrations of the compounds to be tested. The reaction was initiated by 20 incubating the mixture at 25°C. After 15 minutes' incubation, the reaction was terminated by adding 500 microliters of ice cold 20% (w/v) trichloroacetic acid. The precipitate formed was transferred onto a glass fiber filter (Packard Unifilter-GF/B) and washed three times with ethanol. After the filter 25 was dried, the radioactivity was determined by scintillation counting.

Using the PARP assay described above, approximate IC₅₀ values were obtained for the following compounds:

30	PARP Inhibitor	Approximate IC ₅₀ 's
		.25 μM

PARP Inhibitor	Approximate IC ₅₀ 's
	5 μM
	30 μM
	10 μM
	10 μM
	50 μM

PARP Inhibitor	Approximate IC ₅₀ 's
	0.8 μM
	4 μM
	100 μM
	0.9 μM

PARP Inhibitor	Approximate IC ₅₀ 's
	5.2 μM
	0.7 μM
	1.1 μM

5 Similar IC₅₀ values are obtained for the carboxamide compounds of the invention.

Example 3: Neuroprotective Effect of DPQ on Focal Cerebral Ischemia in Rats

10

Focal cerebral ischemia was produced by cauterization of the right distal MCA (middle cerebral artery) with bilateral temporary common carotid artery occlusion in male Long-Evans rats for 90 minutes. All procedures performed on the animals

were approved by the University Institutional Animal Care and Use Committee of the University of Pennsylvania. A total of 42 rats (weights: 230-340 g) obtained from Charles River were used in this study. The animals fasted overnight with 5 free access to water prior to the surgical procedure.

Two hours prior to MCA occlusion, varying amounts (control, n=14; 5 mg/kg, n=7; 10 mg/kg, n=7; 20 mg/kg, n=7; and 40 mg/kg, n=7) of the non-carboxamide compound, 3,4-dihydro-5-[4-(1-piperidinyl)-butoxy]-1(2H)-isoquinolinone 10 ("DPQ") were dissolved in dimethyl sulfoxide (DMSO) using a sonicator. A volume of 1.28 ml/kg of the resulting solution was injected intraperitoneally into fourteen rats.

The rats were then anesthetized with halothane (4% for induction and 0.8%-1.2% for the surgical procedure) in a 15 mixture of 70% nitrous oxide and 30% oxygen. The body temperature was monitored by a rectal probe and maintained at 37.5 ± 0.5°C with a heating blanket regulated by a homeothermic blanket control unit (Harvard Apparatus Limited, Kent, U.K.). A catheter (PE-50) was placed into the tail 20 artery, and arterial pressure was continuously monitored and recorded on a Grass polygraph recorder (Model 7D, Grass Instruments, Quincy, Massachusetts). Samples for blood gas analysis (arterial pH, PaO₂, and PaCO₂) were also taken from the tail artery catheter and measured with a blood gas 25 analyzer (ABL 30, Radiometer, Copenhagen, Denmark). Arterial blood samples were obtained 30 minutes after MCA occlusion.

The head of the animal was positioned in a stereotaxic frame, and a right parietal incision between the right lateral canthus and the external auditory meatus was made. 30 Using a dental drill constantly cooled with saline, a 3 mm burr hole was prepared over the cortex supplied by the right MCA, 4 mm lateral to the sagittal suture and 5 mm caudal to the coronal suture. The dura mater and a thin inner bone layer were kept, care being taken to position the probe over 35 a tissue area devoid of large blood vessels. The flow probe (tip diameter of 1 mm, fiber separation of 0.25 mm) was

lowered to the bottom of the cranial burr hole using a micromanipulator. The probe was held stationary by a probe holder secured to the skull with dental cement. The microvascular blood flow in the right parietal cortex was 5 continuously monitored with a laser Doppler flowmeter (FloLab, Moor, Devon, U.K., and Periflux 4001, Perimed, Stockholm, Sweden).

Focal cerebral ischemia was produced by cauterization of the distal portion of the right MCA with bilateral temporary 10 common carotid artery (CCA) occlusion by the procedure of Chen et al., "A Model of Focal Ischemic Stroke in the Rat: Reproducible Extensive Cortical Infarction", *Stroke* 17:738-43 (1986) and/or Liu et al., "Polyethylene Glycol-conjugated Superoxide Dismutase and Catalase Reduce Ischemic Brain 15 Injury", *Am. J. Physiol.* 256:H589-93 (1989), both of which are hereby incorporated by reference.

Specifically, bilateral CCA's were isolated, and loops made from polyethylene (PE-10) catheter were carefully passed around the CCA's for later remote occlusion. The incision 20 made previously for placement of the laser doppler probe was extended to allow observation of the rostral end of the zygomatic arch at the fusion point using a dental drill, and the dura mater overlying the MCA was cut. The MCA distal to its crossing with the inferior cerebral vein was lifted by a 25 fine stainless steel hook attached to a micromanipulator and, following bilateral CCA occlusion, the MCA was cauterized with an electrocoagulator. The burr hole was covered with a small piece of Gelform, and the wound was sutured to maintain the brain temperature within the normal or near-normal range.

30 After 90 minutes of occlusion, the carotid loops were released, the tail arterial catheter was removed, and all of the wounds were sutured. Gentamicin sulfate (10 mg/ml) was topically applied to the wounds to prevent infection. The anesthetic was discontinued, and the animal was returned to 35 his cage after awakening. Water and food were allowed ad libitum.

Two hours after MCA occlusion, the animals were given the same doses of the PARP inhibitor as in the pre-treatment. Twenty-four hours after MCA occlusion, the rats were sacrificed with an intraperitoneal injection of pentobarbital 5 sodium (150 mg/kg). The brain was carefully removed from the skull and cooled in ice-cold artificial CSF for five minutes. The cooled brain was then sectioned in the coronal plane at 2 mm intervals using a rodent brain matrix (RBM-4000C, ASI Instruments, Warren, Michigan). The brain slices were 10 incubated in phosphate-buffered saline containing 2% 2,3,5-triphenyltetrazolium chloride (TTC) at 37°C for ten minutes. Color photographs were taken of the posterior surface of the stained slices and were used to determine the damaged area at each cross-sectional level using a computer-based image 15 analyzer (NIH Image 1.59). To avoid artifacts due to edema, the damaged area was calculated by subtracting the area of the normal tissue in the hemisphere ipsilateral to the stroke from the area of the hemisphere contralateral to the stroke, by the method of Swanson et al., "A Semiautomated Method for 20 Measuring Brain Infarct Volume", *J. Cereb. Blood Flow Metabol.* 10:290-93 (1990), the disclosure of which is hereby incorporated by reference. The total volume of infarction was calculated by summation of the damaged volume of the brain slices.

25 The cauterization of the distal portion of the right MCA with bilateral temporary CCA occlusion consistently produced a well-recognized cortical infarct in the right MCA territory of each test animal. There was an apparent uniformity in the distribution of the damaged area as measured by TTC staining 30 in each group, as shown in Figure 1.

In Figure 1, the distribution of the cross-sectional infarct area at representative levels along the rostrocaudal axis was measured from the interaural line in non-treated animals and in animals treated with 10 mg/kg of 3,4-dihydro-35 5-[4-(1-piperidinyl)-butoxy]-1(2H)-isoquinolinone. The area of damage was expressed as mean \pm standard deviation.

Significant differences between the 10 mg-treated group and the control group were indicated ($'p<0.02$, $''p<0.01$, $'''p<0.001$). The 5 mg/kg and 20 mg/kg curves fell approximately halfway between the control and the 10 mg/kg curves, whereas the 40 mg/kg curve was close to the control. 5 The 5, 20 and 40 mg/kg curves were omitted for clarity.

PARP inhibition led to a significant decrease in the damaged volume in the 5 mg/kg-treated group ($106.7 \pm 23.2 \text{ mm}^3$, $p<0.001$), the 10 mg/kg-treated group ($76.4 \pm 16.8 \text{ mm}^3$, 10 $p<0.001$), and the 20 mg/kg-treated group ($110.2 \pm 42.0 \text{ mm}^3$, $p<0.01$), compared to the control group ($165.2 \pm 34.0 \text{ mm}^3$). The data are expressed as mean \pm standard deviation. The significance of differences between groups was determined 15 using an analysis of variance (ANOVA) followed by Student's t-test for individual comparisons.

There was no significant difference between the control and the 40 mg/kg-treated group ($135.6 \pm 44.8 \text{ mm}^3$). However, there were significant differences between the 5 mg/kg-treated group and the 10 mg/kg-treated group ($p<0.02$), and 20 between the 10 mg/kg-treated group and the 40 mg/kg-treated group ($p<0.01$), as shown in Figure 2.

In Figure 2, the effect of intraperitoneal administration of 3,4-dihydro-5-[4-(1-piperidinyl)-butoxy]-1(2H)-isoquinolinone on the infarct volume was depicted 25 graphically. The volumes of infarct were expressed as mean \pm standard deviation. Significant differences between the treated groups and the control group were indicated ($'p<0.01$, $''p<0.001$). It is not clear why a high dose (40 mg/kg) of the PARP inhibitor, 3,4-dihydro-5-[4-(1-piperidinyl)-butoxy]-30 1(2H)-isoquinolinone, was less neuroprotective. The U-shaped dose-response curve may suggest dual effects of the compound.

However, overall, the in vivo administration of the inhibitor led to a substantial reduction in infarct volume in the focal cerebral ischemia model in the rat. This result 35 indicated that the activation of PARP plays an important role in the pathogenesis of brain damage in cerebral ischemia.

The values of arterial blood gases (PaO_2 , PaCO_2 and pH) were within the physiological range in the control and treated groups with no significant differences in these parameters among the five groups, as shown below in Table 2. A "steady state" MABP was taken following completion of the surgical preparation, just prior to occlusion; an "ischemia" MABP was taken as the average MABP during occlusion. See Table III below:

TABLE III

	PaO_2 (mm Hg)	PaCO_2 (mm Hg)	pH	MABP (mm Hg) Steady State	MABP (mm Hg) Ischemia
Control group (n=4)	125 \pm 21	38.6 \pm 4.6	7.33 \pm 0.05	79 \pm 14	91 \pm 13**
5 mg/kg-treated group (n=7)	126 \pm 20	38.0 \pm 2.8	7.36 \pm 0.02	78 \pm 5	91 \pm 12**
10 mg/kg-treated group (n=7)	125 \pm 16	39.3 \pm 5.2	7.34 \pm 0.03	80 \pm 9	90 \pm 14*
20 mg/kg-treated group (n=7)	122 \pm 14	41.3 \pm 2.8	7.35 \pm 0.23	79 \pm 10	91 \pm 12**
40 mg/kg-treated group (n=7)	137 \pm 17	39.5 \pm 4.7	7.33 \pm 0.24	78 \pm 4	88 \pm 12*

= Significantly different from the steady state value, $p<0.05$.

** = Significantly different from the steady state value, $p<0.01$.

There were no significant differences in any physiological parameter, including mean arterial blood pressure (MABP), prior to MCA and CCA occlusion among the five groups. Although MABP was significantly elevated following occlusion in all five groups, there were no significant differences in MABP during the occlusion period among the groups.

Since the blood flow values obtained from the laser doppler were in arbitrary units, only percent changes from the baseline (prior to occlusion) were reported. Right MCA and bilateral CCA occlusion produced a significant decrease

in relative blood flow in the right parietal cortex to 20.8 ± 7.7 % of the baseline in the control group (n=5), 18.7 ± 7.4 % in the 5 mg/kg-treated group (n=7), 21.4 ± 7.7 % in the 10 mg/kg-treated group (n=7) and 19.3 ± 11.2 % in the 40 5 mg/kg-treated group (n=7). There were no significant differences in the blood flow response to occlusion among the four groups. In addition, blood flow showed no significant changes throughout the entire occlusion period in any group.

Following release of the carotid occlusions, a good 10 recovery of blood flow (sometimes hyperemia) was observed in the right MCA territory of all animals. Reperfusion of the ischemic tissue resulted in the formation of NO and peroxynitrite, in addition to oxygen-derived free radicals. All of these radicals have been shown to cause DNA strand 15 breaks and to activate PARP.

This example provided evidence that the related compounds of the present invention are effective in inhibiting PARP activity.

20 Example 4: Assay for Neuroprotective Effects on Focal Cerebral Ischemia in Rats

Focal cerebral ischemia experiments are performed using male Wistar rats weighing 250 - 300 g, which are anesthetized with 4% halothane. Anesthesia is maintained with 1.0-1.5% 25 halothane until the end of surgery. The animals are installed in a warm environment to avoid a decrease in body temperature during surgery. An anterior midline cervical incision is made. The right common carotid artery (CCA) is exposed and isolated from the vagus nerve. A silk suture is 30 placed and tied around the CCA in proximity to the heart. The external carotid artery (ECA) is then exposed and ligated with a silk suture. A puncture is made in the CCA and a small catheter (PE 10, Ulrich & Co., St-Gallen, Switzerland) is gently advanced to the lumen of the internal carotid 35 artery (ICA). The pterygopalatine artery is not occluded. The catheter is tied in place with a silk suture. Then, a

4-0 nylon suture (Braun Medical, Crissier, Switzerland) is introduced into the catheter lumen and is pushed until the tip blocks the anterior cerebral artery. The length of catheter into the ICA is approximately 19 mm from the origin 5 of the ECA. The suture is maintained in this position by occlusion of the catheter with heat. One cm of catheter and nylon suture are left protruding so that the suture can be withdrawn to allow reperfusion. The skin incision is then closed with wound clips.

10 The animals are maintained in a warm environment during recovery from anesthesia. Two hours later, the animals are re-anesthetized, the clips are discarded, and the wound is re-opened. The catheter is cut, and the suture is pulled out. The catheter is then obturated again by heat, and wound 15 clips are placed on the wound. The animals are allowed to survive for 24 hours with free access to food and water. The rats are then sacrificed with CO₂ and decapitated. The brains are immediately removed, frozen on dry ice and stored at -80°C. The brains are then cut in 0.02 mm-thick sections in 20 a cryocut at -19°C, selecting one of every 20 sections for further examination. The selected sections are stained with cresyl violet according to the Nissl procedure. Each stained section is examined under a light microscope, and the regional infarct area is determined according to the presence 25 of cells with morphological changes.

Various doses of the compounds of the invention are tested in this model. The compounds are administered in either a single dose or a series of multiple doses, i.p. or i.v., at different times, both before or after the onset of 30 ischemia. Compounds of the invention are found to provide protection from ischemia in the range of about 20 to 80%.

Example 5: Effects on Heart Ischemia/Reperfusion Injury in Rats

35 Female Sprague-Dawley rats, each weighing about 300-350 g are anesthetized with intraperitoneal ketamine at a dose of

150 mg/kg. The rats are endotracheally intubated and ventilated with oxygen-enriched room air using a Harvard rodent ventilator. Polyethylene catheters inserted into the carotid artery and the femoral vein are used for artery blood pressure monitoring and fluid administration respectively. Arterial pCO₂ is maintained between 35 and 45mm Hg by adjusting the respirator rate. The rat chests are opened by median sternotomy, the pericardium is incised, and the hearts are cradled with a latex membrane tent. Hemodynamic data are obtained at baseline after at least a 15-minute stabilization period following the end of the surgical operation. The LAD (left anterior descending) coronary artery is ligated for 40 minutes, and then re-perfused for 120 minutes. After 120 minutes' reperfusion, the LAD artery is re-occluded, and a 0.1 ml bolus of monastral blue dye is injected into the left atrium to determine the ischemic risk region.

The hearts are then arrested with potassium chloride and cut into five 2-3 mm thick transverse slices. Each slice is weighed and incubated in a 1% solution of trimethyltetrazolium chloride to visualize the infarcted myocardium located within the risk region. Infarct size is calculated by summing the values for each left ventricular slice and is further expressed as a fraction of the risk region of the left ventricle.

Various doses of the compounds of the invention are tested in this model. The compounds are given either in a single dose or a series of multiple doses, i.p. or i.v., at different times, both before or after the onset of ischemia. The compounds of the invention are found to have ischemia/reperfusion injury protection in the range of 10 to 40 percent. Therefore, they protect against ischemia-induced degeneration of rat hippocampal neurons in vitro.

Example 6: Retinal Ischemia Protection

A patient just diagnosed with acute retinal ischemia is immediately administered parenterally, either by intermittent

or continuous intravenous administration, a compound of formula I, either as a single dose or a series of divided doses of the compound. After this initial treatment, and depending on the patient's presenting neurological symptoms, 5 the patient optionally may receive the same or a different compound of the invention in the form of another parenteral dose. It is expected by the inventors that significant prevention of neural tissue damage would ensue and that the patient's neurological symptoms would considerably lessen due 10 to the administration of the compound, leaving fewer residual neurological effects post-stroke. In addition, it is expected that the re-occurrence of retinal ischemia would be prevented or reduced.

15 Example 7: Treatment of Retinal Ischemia

A patient has just been diagnosed with acute retinal ischemia. Immediately, a physician or a nurse parenterally administers a compound of formula I, either as a single dose or as a series of divided doses. The patient also receives 20 the same or a different PARP inhibitor by intermittent or continuous administration via implantation of a biocompatible, biodegradable polymeric matrix delivery system comprising a compound of formula I, or via a subdural pump inserted to administer the compound directly to the infarct 25 area of the brain. It is expected by the inventors that the patient would awaken from the coma more quickly than if the compound of the invention were not administered. The treatment is also expected to reduce the severity of the patient's residual neurological symptoms. In addition, it is 30 expected that re-occurrence of retinal ischemia would be reduced.

Example 8: Vascular Stroke Protection

A patient just diagnosed with acute vascular stroke is 35 immediately administered parenterally, either by intermittent or continuous intravenous administration, a compound of

formula I, either as a single dose or a series of divided doses of the compound. After this initial treatment, and depending on the patient's presenting neurological symptoms, the patient optionally may receive the same or a different 5 compound of the invention in the form of another parenteral dose. It is expected by the inventors that significant prevention of neural tissue damage would ensue and that the patient's neurological symptoms would considerably lessen due to the administration of the compound, leaving fewer residual 10 neurological effects post-stroke. In addition, it is expected that the re-occurrence of vascular stroke would be prevented or reduced.

Example 9: Treatment of Vascular Stroke

15 A patient has just been diagnosed with acute multiple vascular strokes and is comatose. Immediately, a physician or a nurse parenterally administers a compound of formula I, either as a single dose or as a series of divided doses. Due to the comatose state of the patient, the patient also 20 receives the same or a different PARP inhibitor by intermittent or continuous administration via implantation of a biocompatible, biodegradable polymeric matrix delivery system comprising a compound of formula I, or via a subdural pump inserted to administer the compound directly to the 25 infarct area of the brain. It is expected by the inventors that the patient would awaken from the coma more quickly than if the compound of the invention were not administered. The treatment is also expected to reduce the severity of the patient's residual neurological symptoms. In addition, it is 30 expected that re-occurrence of vascular stroke would be reduced.

Example 10: Preventing Cardiac Reperfusion Injury

A patient is diagnosed with life-threatening 35 cardiomyopathy and requires a heart transplant. Until a donor heart is found, the patient is maintained on Extra

Corporal Oxygenation Monitoring (ECMO).

A donor heart is then located, and the patient undergoes a surgical transplant procedure, during which the patient is placed on a heart-lung pump. The patient receives a compound 5 of the invention intracardiac within a specified period of time prior to re-routing his or her circulation from the heart-lung pump to his or her new heart, thus preventing cardiac reperfusion injury as the new heart begins to beat independently of the external heart-lung pump.

10

Example 11: Septic Shock Assay

Groups of 10 C57/BL male mice weighing 18 to 20 g were administered a test compound, 1-carboxynaphthalene-1-carboxamide at the doses of 60, 20, 6 and 2 mg/kg, daily, by 15 intraperitoneal (IP) injection for three consecutive days. Each animal was first challenged with lipopolysaccharide (LPS, from E. Coli, LD₁₀₀ of 20 mg/animal IV) plus galactosamine (20 mg/animal IV). The first dose of test compound in a suitable vehicle was given 30 minutes after 20 challenge, and the second and third doses were given 24 hours later on day 2 and day 3 respectively, with only the surviving animals receiving the second or third dose of the test compound. Mortality was recorded every 12 hours after challenge for the three-day testing period. 1-Carboxy-25 naphthalene-1-carboxamide provided a protection against mortality from septic shock of about 40%. Based on these results, other compounds of the invention are expected to provide a protection against mortality exceeding about 35%.

30 Example 12: In vitro Radiosensitization

The human prostate cancer cell line, PC-3s, were plated in 6 well dishes and grown at monolayer cultures in RPMI1640 supplemented with 10% FCS. The cells are maintained at 37°C in 5% CO₂ and 95% air. The cells were exposed to a dose 35 response (0.1 mM to 0.1 µM) of 3 different PARP inhibitors of Formula I disclosed herein prior to irradiation at one

sublethal dose level. For all treatment groups, the six well plates were exposed at room temperature in a Seifert 250kV/15mA irradiator with a 0.5 mm Cu/l mm. Cell viability was examined by exclusion of 0.4% trypan blue. Dye exclusion 5 was assessed visually by microscopy and viable cell number was calculated by subtracting the number of cells from the viable cell number and dividing by the total number of cells. Cell proliferation rates were calculated by the amount of ^3H -thymidine incorporation post-irradiation. The PARP 10 inhibitors show radiosensitization of the cells.

Example 13 *In vivo* Radiosensitization

Before undergoing radiation therapy to treat cancer, a patient is administered an effective amount of a compound or 15 a pharmaceutical composition of the present invention. The compound or pharmaceutical composition acts as a radiosensitizer and making the tumor more susceptible to radiation therapy.

20 Example 14 Measuring Altered Gene Expression in mRNA Senescent Cells

Human fibroblast BJ cells, at Population Doubling (PDL) 94, are plated in regular growth medium and then changed to low serum medium to reflect physiological conditions 25 described in Linskens, et al., *Nucleic Acids Res.* 23:16:3244-3251 (1995). A medium of DMEM/199 supplemented with 0.5% bovine calf serum is used. The cells are treated daily for 13 days with the PARP inhibitor of Formula I as disclosed herein. The control cells are treated with and without the 30 solvent used to administer the PARP inhibitor. The untreated old and young control cells are tested for comparison. RNA is prepared from the treated and control cells according to the techniques described in PCT Publication No. 96/13610 and Northern blotting is conducted. Probes specific for 35 senescence-related genes are analyzed, and treated and control cells compared. In analyzing the results, the lowest

level of gene expression is arbitrarily set at 1 to provide a basis for comparison. Three genes particularly relevant to age-related changes in the skin are collagen, collagenase and elastin. West, Arch. Derm. 130:87-95 (1994). Elastin expression of the cells treated with the PARP inhibitor of Formula I is significantly increased in comparison with the control cells. Elastin expression is significantly higher in young cells compared to senescent cells, and thus treatment with the PARP inhibitor of Formula I causes elastin expression levels in senescent cells to change to levels similar to those found in much younger cells. Similarly, a beneficial effect is seen in collagenase and collagen expression with treatment with the PARP inhibitors of Formula I.

15

Example 15 Measuring Altered Gene Expression Protein in Senescent Cells

Approximately 105 BJ cells, at PDL 95-100 are plated and grown in 15 cm dishes. The growth medium is DMEM/199 20 supplemented with 10% bovine calf serum. The cells are treated daily for 24 hours with the PARP inhibitors of Formula I (100 µg/ 1 mL of medium). The cells are washed with phosphate buffered solution (PBS), then permeabilized with 4% paraformaldehyde for 5 minutes, then washed with PBS, 25 and treated with 100% cold methanol for 10 minutes. The methanol is removed and the cells are washed with PBS, and then treated with 10% serum to block nonspecific antibody binding. About 1 mL of the appropriate commercially available antibody solutions (1:500 dilution. Vector) is 30 added to the cells and the mixture incubated for 1 hour. The cells are rinsed and washed three times with PBS. A secondary antibody, goat anti-mouse IgG (1 mL) with a biotin tag is added along with 1 mL of a solution containing streptavidin conjugated to alkaline phosphatase and 1 mL of 35 NBT reagent (Vector). The cells are washed and changes in gene expression are noted colorimetrically. Four senescence-

specific genes -- collagen I, collagen III, collagenase, and interferon gamma -- in senescent cells treated with the PARP inhibitor of Formula I are monitored and the results show a decrease in interferon gamma expression with no observable 5 change in the expression levels of the other three gens, demonstrating that the PARP inhibitors of Formula I can alter senescence-specific gene expression.

10 Example 16 Extending or Increasing Proliferative Capacity and Lifespan of Cells

To demonstrate the effectiveness of the present method for extending the proliferative capacity and lifespan of cells, human fibroblast cells lines (either W138 at Population Doubling (PDL) 23 or BJ cells at PDL 71) are 15 thawed and plated on T75 flasks and allowed to grow in normal medium (DMEM/M199 plus 10% bovine calf serum) for about a week, at which time the cells are confluent, and the cultures are therefor ready to be subdivided. At the time of subdivision, the media is aspirated, and the cells rinsed 20 with phosphate buffer saline (PBS) and then trypsinized. The cells are counted with a Coulter counter and plated at a density of 10^3 cells per cm^2 in 6-well tissue culture plates in DMEM/199 medium supplemented with 10% bovine calf serum and varying amounts (0.10 μM , and 1mM: from a 100X stock 25 solution in DMEM/M199 medium) of a PARP inhibitor of Formula I as disclosed herein. This process is repeated every 7 days until the cell appear to stop dividing. The untreated (control) cells reach senescence and stop dividing after about 40 days in culture. Treatment of cells with 10 μM 3-AB 30 appears to have little or no effect in contrast to treatment with 100 μM 3-AB which appears lengthen the lifespan of the cells and treatment with 1 mM 3-AB which dramatically increases the lifespan and proliferative capacity of the cells. The cells treated with 1 mM 3-AB will still divide 35 after 60 days in culture.

Example 16: Neuroprotective Effects of Formula I on

Chronic Constriction Injury (CCI) in Rats

Adult male Sprague-Dawley rats, 300-350 g, are anesthetized with intraperitoneal 50 mg/kg sodium pentobarbital. Nerve ligation is performed by exposing one side of the rat's sciatic nerves and dissecting a 5-7 mm-long nerve segment and closing with four loose ligatures at a 1.0-1.5-mm, followed by implanting of an intrathecal catheter and inserting of a gentamicin sulfate-flushed polyethylene (PE-10) tube into the subarachnoid space through an incision at the cisterna magna. The caudal end of the catheter is gently threaded to the lumbar enlargement and the rostral end is secured with dental cement to a screw embedded in the skull and the skin wound is closed with wound clips.

Thermal hyperalgesia to radiant heat is assessed by using a paw-withdrawal test. The rat is placed in a plastic cylinder on a 3-mm thick glass plate with a radiant heat source from a projection bulb placed directly under the plantar surface of the rat's hindpaw. The paw-withdrawal latency is defined as the time elapsed from the onset of radiant heat stimulation to withdrawal of the rat's hindpaw.

Mechanical hyperalgesia is assessed by placing the rat in a cage with a bottom made of perforated metal sheet with many small square holes. Duration of paw-withdrawal is recorded after pricking the mid-plantar surface of the rat's hindpaw with the tip of a safety pin inserted through the cage bottom.

Mechano-allodynia is assessed by placing a rat in a cage similar to the previous test, and applying von Frey filaments in ascending order of bending force ranging from 0.07 to 76 g to the mid-plantar surface of the rat's hindpaw. A von Frey filament is applied perpendicular to the skin and depressed slowly until it bends. A threshold force of response is defined as the first filament in the series to evoke at least one clear paw-withdrawal out of five applications.

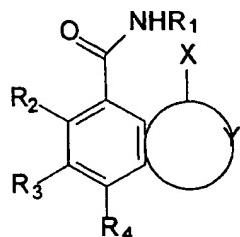

Dark neurons are observed bilaterally within the spinal

cord dorsal horn, particularly in laminae I-II, of rats 8 days after unilateral sciatic nerve ligation as compared with sham operated rats. Various doses of differing compounds of Formula I are tested in this model and show that the Formula 5 I compounds reduce both incidence of dark neurons and neuropathic pain behavior in CCI rats.

The invention being thus described, it will be obvious that the same may be varied in many ways. Such variations are not to be regarded as a departure from the spirit and 10 scope of the invention, and all such modifications are intended to be included within the scope of the following claims.

We claim:

1. A compound of formula I:

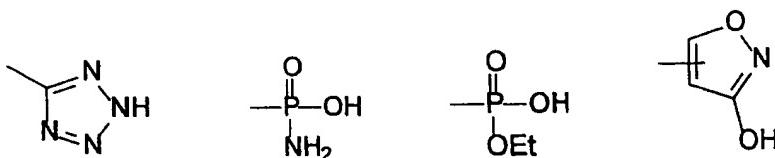

I

5

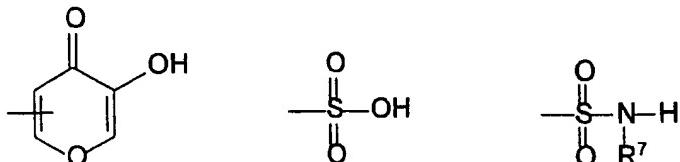

or a pharmaceutically acceptable salt, hydrate, ester, solvate, prodrug, metabolite, stereoisomer, or mixtures thereof; wherein:

Y represents the atoms necessary to form a fused 5- to
10 6-membered, aromatic or non-aromatic, carbocyclic or O, S, N-containing heterocyclic ring, wherein Y and any heteroatom(s) therein are unsubstituted or independently substituted with at least one non-interfering alkyl, alkenyl, cycloalkyl, cycloalkenyl, aralkyl, aryl, carboxy or halo substituent;

15 X is at the 1-position of ring Y and is -COOR₅ or a substituted or unsubstituted moiety selected from the group consisting of

20

and , wherein R⁷ is

hydrogen, alkyl, alkenyl, cycloalkyl or cycloalkenyl, and is itself either unsubstituted or substituted with an alkyl, alkenyl, cycloalkyl or cycloalkenyl group;

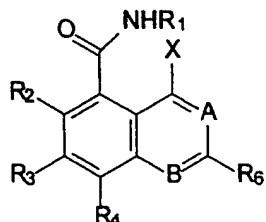

5 R₁ is hydrogen, alkyl, alkenyl, cycloalkyl or cycloalkenyl, and is itself either unsubstituted or substituted with an alkyl, alkenyl, cycloalkyl or cycloalkenyl group;

10 R₂, R₃, R₄ and R₅ are independently hydrogen, alkyl, alkenyl, cycloalkyl, cycloalkenyl, aralkyl, aryl, amino, hydroxyl, 1-piperazine, 1-piperidine, or 1-imidazoline, and are either unsubstituted or substituted with a moiety selected from the group consisting of alkyl, alkenyl, alkoxy, phenoxyl, benzyloxy, cycloalkyl, cycloalkenyl, hydroxy, carboxy, carbonyl, amino, amido, cyano, isocyano, nitro, nitroso, nitrilo, isonitrilo, imino, azo, diazo, sulfonyl, sulfoxy, thio, thiocarbonyl, sulfhydryl, halo, haloalkyl, trifluoromethyl, 15 aralkyl and aryl;

20 provided that, when Y is a fused, 6-membered, aromatic carbocyclic ring, and R₁, R₂, R₃ and R₄ are each hydrogen, X is not a -COOH group.

25 2. The compound of claim 1, wherein Y has at least one site of unsaturation.

3. The compound of claim 1, wherein said compound has formula II:

or a pharmaceutically acceptable salt, hydrate, ester, solvate, prodrug, metabolite, stereoisomer, or mixtures thereof; wherein A and B are independently carbon or nitrogen and are optionally and independently unsubstituted or substituted with alkyl, alkenyl, cycloalkyl, cycloalkenyl, aralkyl or aryl group; provided that at least one of A and B is nitrogen.

4. The compound of claim 1, wherein Y represents the atoms necessary to form a 5- to 6-membered carbocyclic ring.

5. The compound of claim 4, wherein Y is aromatic.

15 6. The compound of claim 4, wherein Y represents the atoms necessary to form a fused benzene ring.

7. The compound of claim 4, wherein Y is non-aromatic.

20 8. The compound of claim 1, wherein Y represents the atoms necessary to form a 5- to 6-membered, N-containing ring.

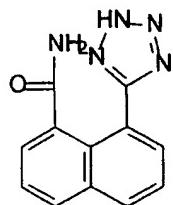

9. The compound of claim 8, wherein Y is aromatic.

25 10. The compound of claim 8, wherein Y is non-aromatic.

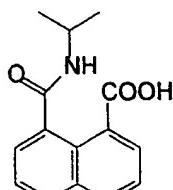

11. The compound of claim 1, wherein said compound 30 has an isoquinoline, a quinoline, a naphthalene, a phenanthridine, a phthalazine, a phthalhydrazide, or a quinazoline nucleus.

12. The compound of claim 11, wherein said compound 35 has an isoquinoline, a quinoline or a naphthalene nucleus.

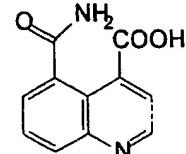

13. The compound of claim 1, wherein the compound is selected from the group consisting of

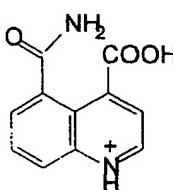

I

II

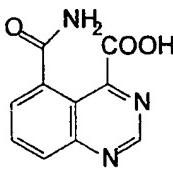

III

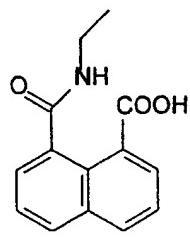

5

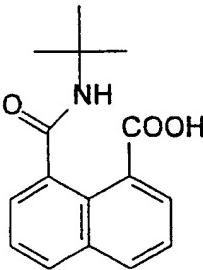

IV

V

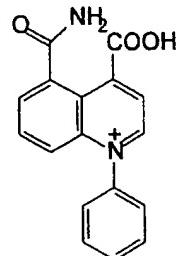

VI

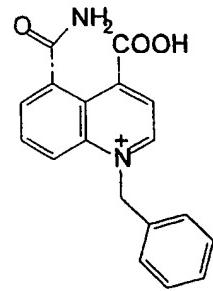

VII

VIII

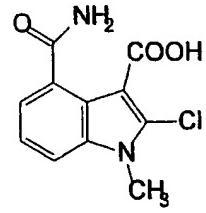

IX

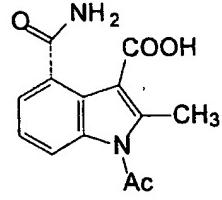

10

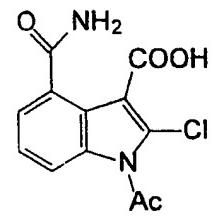

X

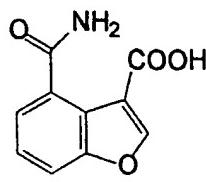

XI

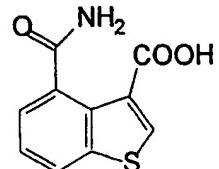

XII

XIII

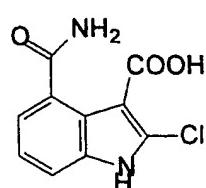

XIV

XV

XVI

XVII

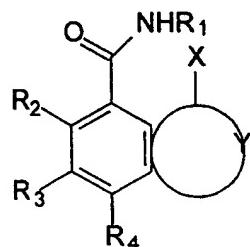

XVIII.

14. The compound of claim 1, wherein said compound has an IC₅₀ of 100 µM or lower for inhibiting poly(ADP-ribose) polymerase in vitro.

15. The compound of claim 1, wherein said compound has an IC₅₀ of 25 µM or lower for inhibiting poly(ADP-ribose) polymerase in vitro.

16. A pharmaceutical composition comprising a pharmaceutically acceptable carrier and a compound of formula I:

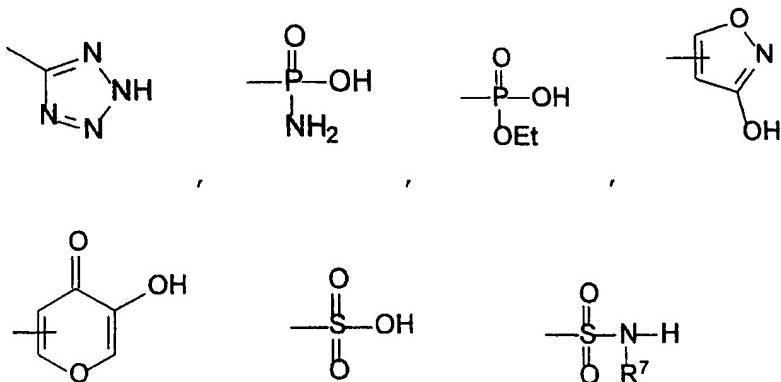

I

15 or a pharmaceutically acceptable salt, hydrate, ester, solvate, prodrug, metabolite, stereoisomer, or mixtures thereof; wherein:

20 Y represents the atoms necessary to form a fused 5- to 6-membered, aromatic or non-aromatic, carbocyclic or N-containing heterocyclic ring, wherein Y and any heteroatom(s) therein are unsubstituted or independently substituted with at least one non-interfering alkyl, alkenyl, cycloalkyl, cycloalkenyl, aralkyl, aryl, carboxy or halo substituent;

25 X is at the 1-position of ring Y and is -COOR₅ or a

substituted or unsubstituted moiety selected from the group consisting of

and , wherein R' is

5 hydrogen, alkyl, alkenyl, cycloalkyl or cyclo-
alkenyl, and is itself either unsubstituted or
substituted with an alkyl, alkenyl, cycloalkyl or
cycloalkenyl group;

10 R₁ is hydrogen, alkyl, alkenyl, cycloalkyl or cycloalkenyl, and is itself either unsubstituted or substituted with an alkenyl, cycloalkyl or cycloalkenyl group.

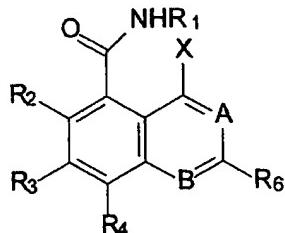

15 R₂, R₃, R₄ and R₅ are independently hydrogen, alkyl, alkenyl, cycloalkyl, cycloalkenyl, aralkyl, aryl, amino, hydroxyl, 1-piperazine, 1-piperidine, or 1-imidazoline, and are either unsubstituted or substituted with a moiety selected from the group consisting of alkyl, alkenyl, alkoxy, phenoxy,

benzyloxy, cycloalkyl, cycloalkenyl, hydroxy,
carboxy, carbonyl, amino, amido, cyano, isocyano,
nitro, nitroso, nitrilo, isonitrilo, imino, azo,
diazo, sulfonyl, sulfoxy, thio, thiocarbonyl,
sulphydryl, halo, haloalkyl, trifluoromethyl,
aralkyl and aryl;

provided that, when Y is a fused, 6-membered, aromatic carbocyclic ring, and R₁, R₂, R₃ and R₄ are each hydrogen, X is not a -COOH group.

17. The composition of claim 16, wherein Y has at least one site of unsaturation.

18. The pharmaceutical composition of claim 16,
5 wherein said compound has formula II:

II

or a pharmaceutically acceptable salt, hydrate, ester, solvate, prodrug, metabolite, stereoisomer, or mixtures 10 thereof; wherein:

A and B are independently carbon or nitrogen and are optionally and independently unsubstituted or substituted with alkyl, alkenyl, cycloalkyl, cycloalkenyl, aralkyl or aryl group;

15 provided that at least one of A and B is nitrogen.

19. The composition of claim 16, wherein Y represents the atoms necessary to form a fused benzene ring.

20 20. The composition of claim 16, wherein said compound has an isoquinoline, a quinoline, a naphthalene, a phenanthridine, a phthalazine, a phthalhydrazide, or a quinazoline nucleus.

25 21. The composition of claim 20, wherein said compound has an isoquinoline, a quinoline or a naphthalene nucleus.

22. The composition of claim 16, wherein Y represents 30 the atoms necessary to form a 5- to 6- membered carbocyclic

ring.

23. The composition of claim 22, wherein Y is aromatic.

5

24. The composition of claim 22, wherein Y is non-aromatic.

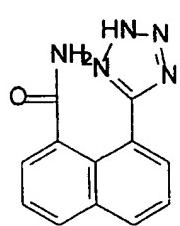

10 25. The composition of claim 16, wherein Y represents the atoms necessary to form a 5- to 6- membered, N-containing heterocyclic ring.

15 26. The composition of claim 25, wherein Y is aromatic.

15

27. The composition of claim 25, wherein Y is non-aromatic.

20 28. The composition of claim 16, wherein the compound is selected from the group consisting of

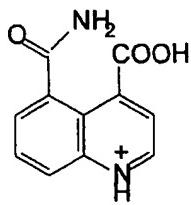

I

II

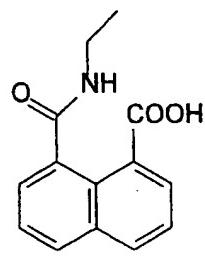

III

5 29. The composition of claim 16, wherein said compound has an IC₅₀ of 100 µM or lower for inhibiting poly(ADP-ribose) polymerase in vitro.

10 30. The composition of claim 16, wherein said agent has an IC₅₀ of 25 µM or lower for inhibiting poly(ADP-ribose) polymerase in vitro.

15 31. The composition of claim 16, wherein said composition is administered as a sterile solution, suspension or emulsion, in a single or divided dose.

20 32. The composition of claim 16, wherein said composition is administered as a solid implant capable of releasing the compound over a prolonged period of time.

25 33. The composition of claim 16, wherein said composition is administered as a capsule or tablet containing a single or divided dose of said compound.

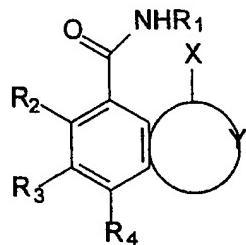

30 34. The composition of claim 16, wherein the carrier comprises a biodegradable polymer.

35 35. The composition of claim 34, wherein the composition is a solid implant.

30 36. The composition of claim 34, wherein the biodegradable polymer releases the compound of formula I over a prolonged period of time.

37. The pharmaceutical composition of claim 16 for treatment or prevention of diseases or conditions selected from the group consisting of tissue damage resulting from 5 cell damage or death due to necrosis or apoptosis, neuronal mediated tissue damage or diseases, neural tissue damage resulting from ischemia and reperfusion injury, neurological disorders and neurodegenerative diseases, vascular stroke, cardiovascular disorders, age-related 10 macular degeneration, AIDS and other immune senescence diseases, arthritis, atherosclerosis, cachexia, cancer, degenerative diseases of skeletal muscle involving replicative senescence, diabetes, head trauma, immune 15 senescence, inflammatory bowel disorders, muscular dystrophy, osteoarthritis, osteoporosis, chronic pain, acute pain, neuropathic pain, nervous insult, peripheral nerve injury, renal failure, retinal ischemia, septic shock, and skin aging, diseases or disorders relating to lifespan or proliferative capacity of cells, and diseases 20 or disease conditions induced or exacerbated by cellular senescence.

38. A pharmaceutical composition comprising a pharmaceutically acceptable carrier and a compound of formula I:

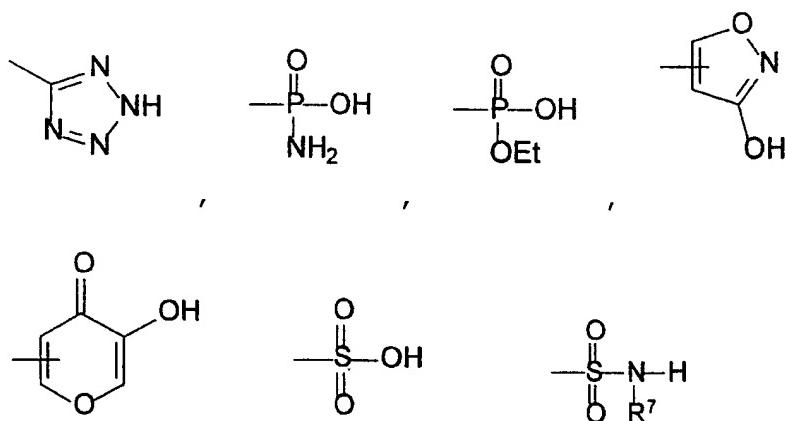

25 or a pharmaceutically acceptable salt, hydrate, ester, solvate, prodrug, metabolite, stereoisomer, or mixtures thereof, wherein the compound of formula I is present in an amount effective for inhibiting PARP activity; and 30 wherein:

I

Y represents the atoms necessary to form a fused 5- to 6-membered, aromatic or non-aromatic, carbocyclic or N-containing heterocyclic ring, wherein Y and any heteroatom(s) therein are unsubstituted or independently substituted with at least one non-interfering alkyl, alkenyl, cycloalkyl, cycloalkenyl, aralkyl, aryl, carboxy or halo substituent;

X is at the 1-position of ring Y and is -COOR₅ or a substituted or unsubstituted moiety selected from the group consisting of

and , wherein R⁻ is hydrogen, alkyl, alkenyl, cycloalkyl or cycloalkenyl, and is itself either unsubstituted or substituted with an alkyl, alkenyl, cycloalkyl or cycloalkenyl group;

R₁ is hydrogen, alkyl, alkenyl, cycloalkyl or cycloalkenyl, and is itself either unsubstituted or substituted with an alkyl, alkenyl, cycloalkyl or cycloalkenyl group;

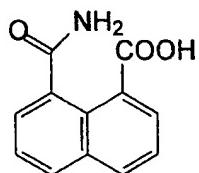

R₂, R₃, R₄ and R₅ are independently hydrogen, alkyl, alkenyl, cycloalkyl, cycloalkenyl, aralkyl, aryl, amino, hydroxyl, 1-piperazine, 1-piperidine, or 1-imidazoline, and are either unsubstituted or substituted with a moiety selected from the group consisting of alkyl, alkenyl, alkoxy, phenoxy,

5

benzyloxy, cycloalkyl, cycloalkenyl, hydroxy, carboxy, carbonyl, amino, amido, cyano, isocyano, nitro, nitroso, nitrilo, isonitrilo, imino, azo, diazo, sulfonyl, sulfoxy, thio, thiocarbonyl, sulfhydryl, halo, haloalkyl, trifluoromethyl, aralkyl and aryl.

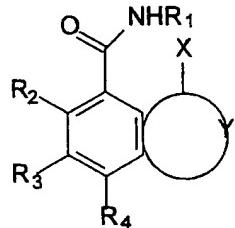

39. The composition of claim 38 wherein, when Y is a fused, 6-membered, aromatic carbocyclic ring, and R₁, R₂, R₃ and R₄ are each hydrogen, X is not a -COOH group.

40. The composition of claim 38, wherein the compound is

15

41. A pharmaceutical composition comprising a pharmaceutically acceptable carrier and a compound of formula I:

I

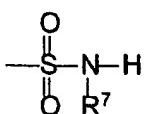

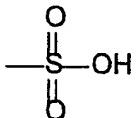

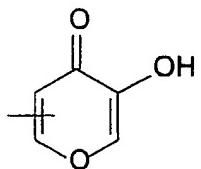

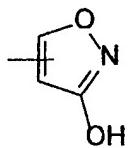

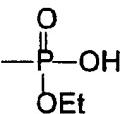

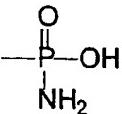

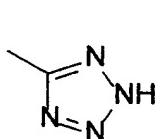

or a pharmaceutically acceptable salt, hydrate, ester, solvate, prodrug, metabolite, stereoisomer, or mixture thereof, wherein the compound of formula I is present in an amount that is effective for effecting a neuronal activity not mediated by NMDA toxicity; and wherein:

Y represents the atoms necessary to form a fused 5- to 25 6-membered, aromatic or non-aromatic, carbocyclic or N-containing heterocyclic ring, wherein Y and

any heteroatom(s) therein are unsubstituted or independently substituted with at least one non-interfering alkyl, alkenyl, cycloalkyl, cycloalkenyl, aralkyl, aryl, carboxy or halo substituent;

5

X is at the 1-position of ring Y and is -COOR₅ or a substituted or unsubstituted moiety selected from the group consisting of

10

and , wherein R⁷ is

15

hydrogen, alkyl, alkenyl, cycloalkyl or cycloalkenyl, and is itself either unsubstituted or substituted with an alkyl, alkenyl, cycloalkyl or cycloalkenyl group;

15

R₁ is hydrogen, alkyl, alkenyl, cycloalkyl or cycloalkenyl, and is itself either unsubstituted or substituted with an alkyl, alkenyl, cycloalkyl or cycloalkenyl group;

20

R₂, R₃, R₄ and R₅ are independently hydrogen, alkyl, alkenyl, cycloalkyl, cycloalkenyl, aralkyl aryl, amino, hydroxyl, 1-piperazine, 1-piperidine, or 1-imidazoline, and are either unsubstituted or substituted with a moiety selected from the group consisting of alkyl, alkenyl, alkoxy, phenoxy, benzyloxy, cycloalkyl, cycloalkenyl, hydroxy, carboxy, carbonyl, amino, amido, cyano, isocyano, nitro, nitroso, nitrilo, isonitrilo, imino, azo,

25

diazo, sulfonyl, sulfoxy, thio, thiocarbonyl, sulfhydryl, halo, haloalkyl, trifluoromethyl, aralkyl and aryl.

5 42. The composition of claim 41 wherein, when Y is a fused, 6-membered, aromatic carbocyclic ring, and R₁, R₂, R₃, and R₄ are each hydrogen, X is not a -COOH group.

10 43. The composition of claim 41, wherein the compound is

15 44. The composition of claim 41, wherein the neuronal activity is selected from the group consisting of stimulation of damaged neurons, promotion of neuronal regeneration, prevention of neurodegeneration, and treatment of a neurological disorder.

20 45. The composition of claim 44, wherein said damaged neurons result from cerebral ischemia or reperfusion injury.

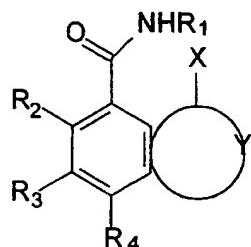

25 46. The composition of claim 44, wherein the neurological disorder is selected from the group consisting of peripheral neuropathy caused by physical injury or disease state, traumatic brain injury, physical damage to the spinal cord, stroke associated with brain damage, demyelinating disease and neurological disorder relating to neurodegeneration.

30

47. The composition of claim 46, wherein the neurological disorder relating to neurodegeneration is

selected from the group consisting of Alzheimer's Disease, Parkinson's Disease, Huntington's Disease and amyotrophic lateral sclerosis.

5 48. A pharmaceutical composition comprising a pharmaceutically acceptable carrier and a compound of formula I:

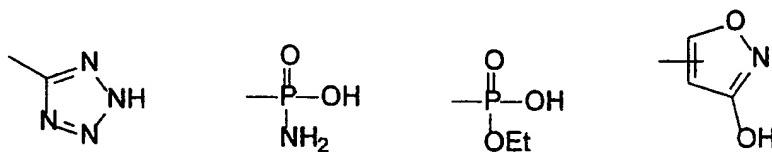

I

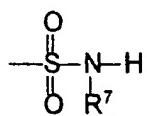

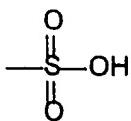

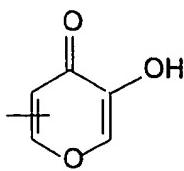

or a pharmaceutically acceptable salt, hydrate, ester,
10 solvate, prodrug, metabolite, stereoisomer, or mixtures
thereof, wherein the compound of formula I is present in an
amount that is effective for treating arthritis; and
wherein:

Y represents the atoms necessary to form a fused 5- to
15 6-membered, aromatic or non-aromatic, carbocyclic
or N-containing heterocyclic ring, wherein Y and
any heteroatom(s) therein are unsubstituted or
independently substituted with at least one non-
interfering alkyl, alkenyl, cycloalkyl,
20 cycloalkenyl, aralkyl, aryl, carboxy or halo
substituent;

X is at the 1-position of ring Y and is -COOR₅ or a
substituted or unsubstituted moiety selected from
the group consisting of

25

, and , wherein R⁷ is

hydrogen, alkyl, alkenyl, cycloalkyl or cycloalkenyl, and is itself either unsubstituted or substituted with an alkyl, alkenyl, cycloalkyl or cycloalkenyl group;

5 R₁ is hydrogen, alkyl, alkenyl, cycloalkyl or cycloalkenyl, and is itself either unsubstituted or substituted with an alkyl, alkenyl, cycloalkyl or cycloalkenyl group;

10 R₂, R₃, R₄ and R₅ are independently hydrogen, alkyl,

alkenyl, cycloalkyl, cycloalkenyl, aralkyl, aryl, amino, hydroxyl, 1-piperazine, 1-piperidine, or 1-imidazoline, and are either unsubstituted or

15 substituted with a moiety selected from the group consisting of alkyl, alkenyl, alkoxy, phenoxy, benzyloxy, cycloalkyl, cycloalkenyl, hydroxy, carboxy, carbonyl, amino, amido, cyano, isocyano, nitro, nitroso, nitrilo, isonitrilo, imino, azo,

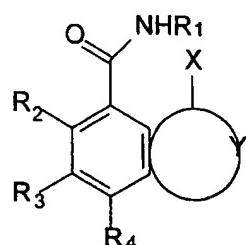

20 diazo, sulfonyl, sulfoxy, thio, thiocarbonyl, sulfhydryl, halo, haloalkyl, trifluoromethyl, aralkyl and aryl.

49. The composition of claim 48, wherein the compound
25 is

50. A pharmaceutical composition comprising a pharma-

aceutically acceptable carrier and a compound of formula I:

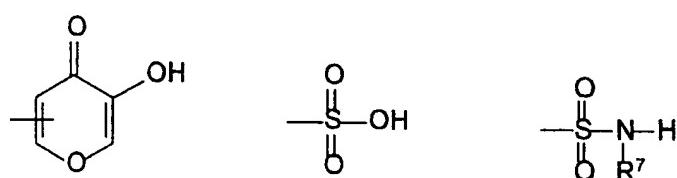

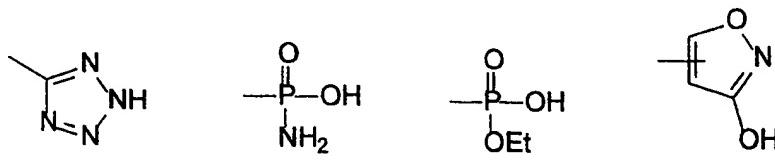

I

or a pharmaceutically acceptable salt, hydrate, ester,
5 solvate, prodrug, metabolite, stereoisomer, or mixtures
thereof, wherein the compound of formula I is present in an
amount that is effective for treating diabetes; and
wherein:

Y represents the atoms necessary to form a fused 5- to
10 6-membered, aromatic or non-aromatic, carbocyclic
or N-containing heterocyclic ring, wherein Y and
any heteroatom(s) therein are unsubstituted or
independently substituted with at least one non-
interfering alkyl, alkenyl, cycloalkyl,
15 cycloalkenyl, aralkyl, aryl, carboxy or halo
substituent;

X is at the 1-position of ring Y and is -COOR₅ or a
substituted or unsubstituted moiety selected from
the group consisting of

20

and , wherein R' is

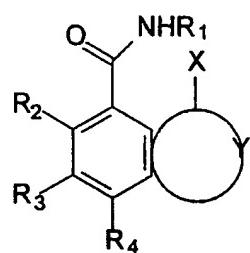

hydrogen, alkyl, alkenyl, cycloalkyl or cyclo-alkenyl, and is itself either unsubstituted or substituted with an alkyl, alkenyl, cycloalkyl or cycloalkenyl group;

5 R₁ is hydrogen, alkyl, alkenyl, cycloalkyl or cyclo-alkenyl, and is itself either unsubstituted or substituted with an alkyl, alkenyl, cycloalkyl or cycloalkenyl group;

10 R₂, R₃, R₄ and R₅ are independently hydrogen, alkyl, alkenyl, cycloalkyl, cycloalkenyl, aralkyl, aryl, amino, hydroxyl, 1-piperazine, 1-piperidine, or 1-imidazoline, and are either unsubstituted or substituted with a moiety selected from the group consisting of alkyl, alkenyl, alkoxy, phenoxy, benzyloxy, cycloalkyl, cycloalkenyl, hydroxy, carboxy, carbonyl, amino, amido, cyano, isocyano, nitro, nitroso, nitrilo, isonitrilo, imino, azo, diazo, sulfonyl, sulfoxy, thio, thiocarbonyl, sulphydryl, halo, haloalkyl, trifluoromethyl, aralkyl and aryl.

15 51. The composition of claim 50 wherein, when Y is a fused, 6-membered, aromatic carbocyclic ring, and R₁, R₂, R₃ and R₄ are each hydrogen, X is not a -COOH group.

20 52. A pharmaceutical composition comprising a pharmaceutically acceptable carrier and a compound of formula I:

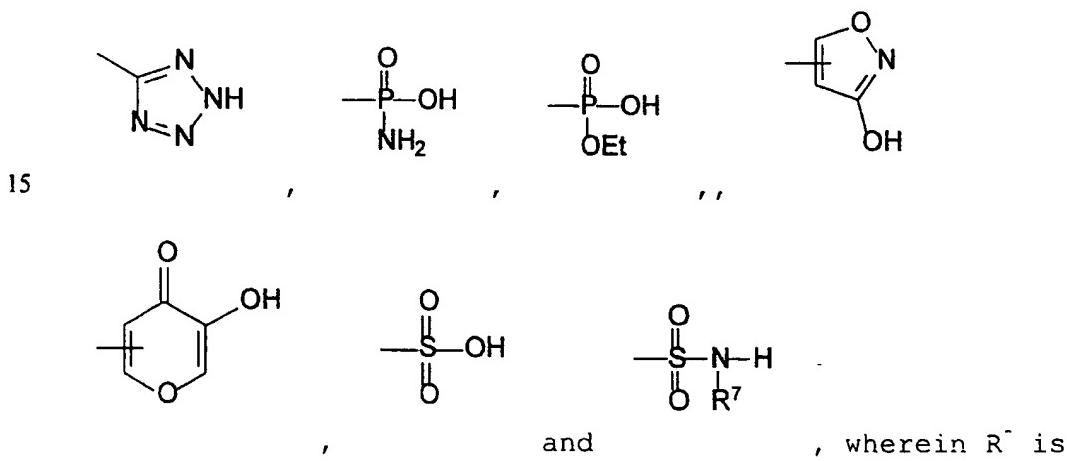

25 I
or a pharmaceutically acceptable salt, hydrate, ester,
30 solvate, prodrug, metabolite, stereoisomer, or mixtures

thereof, wherein the compound of formula I is present in an amount that is effective for treating an inflammatory bowel disorder; and wherein:

Y represents the atoms necessary to form a fused 5-
5 to 6-membered, aromatic or non-aromatic,
carbocyclic or N-containing heterocyclic ring,
wherein Y and any heteroatom(s) therein are
unsubstituted or independently substituted with
at least one non-interfering alkyl, alkenyl,
10 cycloalkyl, cycloalkenyl, aralkyl, aryl, carboxy
or halo substituent;

X is at the 1-position of ring Y and is -COOR₅ or a
substituted or unsubstituted moiety selected
from the group consisting of

hydrogen, alkyl, alkenyl, cycloalkyl or cyclo-
alkenyl, and is itself either unsubstituted or
20 substituted with an alkyl, alkenyl, cycloalkyl
or cycloalkenyl group;

R₁ is hydrogen, alkyl, alkenyl, cycloalkyl or cyclo-
alkenyl, and is itself either unsubstituted or
substituted with an alkyl, alkenyl, cycloalkyl
25 or cycloalkenyl group;

R₂, R₃, R₄ and R₅ are independently hydrogen, alkyl,
alkenyl, cycloalkyl, cycloalkenyl, aralkyl,
aryl, amino, hydroxyl, 1-piperazine, 1-

5

piperidine, or 1-imidazoline, and are either unsubstituted or substituted with a moiety selected from the group consisting of alkyl, alkenyl, alkoxy, phenoxy, benzyloxy, cycloalkyl, cycloalkenyl, hydroxy, carboxy, carbonyl, amino, amido, cyano, isocyano, nitro, nitroso, nitrilo, isonitrilo, imino, azo, diazo, sulfonyl, sulfoxy, thio, thiocarbonyl, sulfhydryl, halo, haloalkyl, trifluoromethyl, aralkyl and aryl.

10

53. The composition of claim 52 wherein, when Y is a fused, 6-membered, aromatic carbocyclic ring, and R₁, R₂, R₃ and R₄ are each hydrogen, X is not a -COOH group.

15

54. The composition of claim 52, wherein the compound is

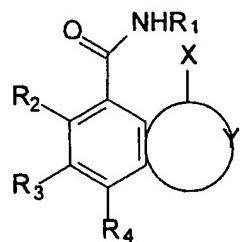

20

55. The composition of claim 52, wherein the bowel disorder is colitis.

56. The composition of claim 52, wherein the bowel disorder is Crohn's disease.

25

57. A pharmaceutical composition comprising a pharmaceutically acceptable carrier and a compound of formula I:

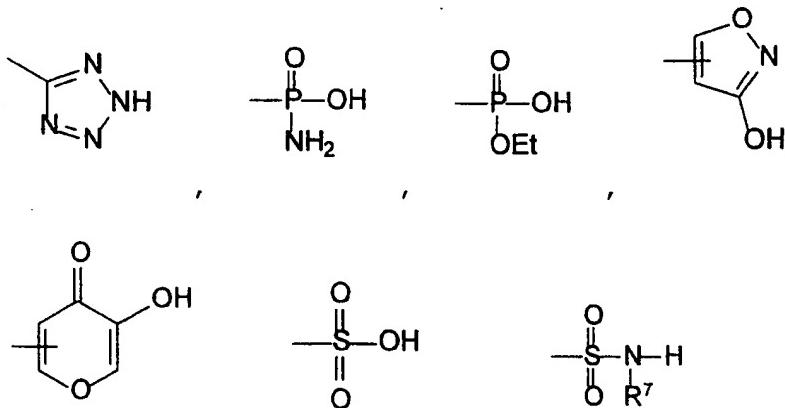

I

or a pharmaceutically acceptable salt, hydrate, ester, solvate, prodrug, metabolite, stereoisomer, or mixtures thereof, wherein the compound of formula I is present in an amount that is effective for treating a cardiovascular disorder; and wherein:

Y represents the atoms necessary to form a fused 5-
to 6-membered, aromatic or non-aromatic,
10 carbocyclic or N-containing heterocyclic ring,
wherein Y and any heteroatom(s) therein are
unsubstituted or independently substituted with
at least one non-interfering alkyl, alkenyl,
cycloalkyl, cycloalkenyl, aralkyl, aryl, carboxy
15 or halo substituent;

X is at the 1-position of ring Y and is -COOR₅ or a
substituted or unsubstituted moiety selected
from the group consisting of

20 and , wherein R⁷ is
hydrogen, alkyl, alkenyl, cycloalkyl or cyclo-

alkenyl, and is itself either unsubstituted or substituted with an alkyl, alkenyl, cycloalkyl or cycloalkenyl group;

R₁ is hydrogen, alkyl, alkenyl, cycloalkyl or cycloalkenyl, and is itself either unsubstituted or substituted with an alkyl, alkenyl, cycloalkyl or cycloalkenyl group;

R₂, R₃, R₄ and R₅ are independently hydrogen, alkyl, alkenyl, cycloalkyl, cycloalkenyl, aralkyl, aryl, amino, hydroxyl, 1-piperazine, 1-piperidine, or 1-imidazoline, and are either unsubstituted or substituted with a moiety selected from the group consisting of alkyl, alkenyl, alkoxy, phenoxy, benzyloxy, cycloalkyl, cycloalkenyl, hydroxy, carboxy, carbonyl, amino, amido, cyano, isocyano, nitro, nitroso, nitrilo, isonitrilo, imino, azo, diazo, sulfonyl, sulfoxy, thio, thiocarbonyl, sulfhydryl, halo, haloalkyl, trifluoromethyl, aralkyl and aryl.

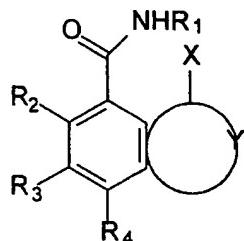

58. The composition of claim 57, wherein, when Y is a fused, 6-membered, aromatic carbocyclic ring, and R₁, R₂, R₃ and R₄ are each hydrogen, X is not a -COOH group.

59. The composition of claim 57, wherein the compound is

60. The composition of claim 57, wherein the cardiovascular disorder is coronary artery disease, myocardial infarction, angina pectoris, cardiogenic shock and cardiovascular tissue damage.

61. A pharmaceutical composition comprising a pharmaceutically acceptable carrier and a compound of formula I:

I

5

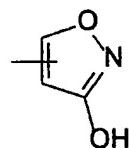

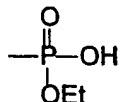

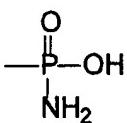

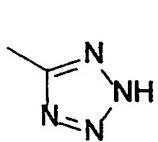

or a pharmaceutically acceptable salt, hydrate, ester, solvate, prodrug, metabolite, stereoisomer, or mixtures thereof, wherein the compound of formula I is present in an amount that is effective for treating septic shock; and
10 wherein:

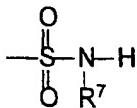

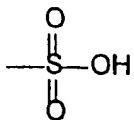

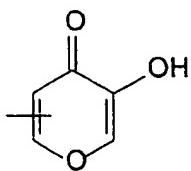

15

Y represents the atoms necessary to form a fused 5- to 6-membered, aromatic or non-aromatic, carbocyclic or N-containing heterocyclic ring, wherein Y and any heteroatom(s) therein are unsubstituted or independently substituted with at least one non-interfering alkyl, alkenyl, cycloalkyl, cycloalkenyl, aralkyl, aryl, carboxy or halo substituent;

20

X is at the 1-position of ring Y and is -COOR₅ or a substituted or unsubstituted moiety selected from the group consisting of

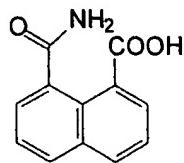

and , wherein R' is
hydrogen, alkyl, alkenyl, cycloalkyl or cyclo-
alkenyl, and is itself either unsubstituted or
substituted with an alkyl, alkenyl, cycloalkyl
or cycloalkenyl group;
R₁ is hydrogen, alkyl, alkenyl, cycloalkyl or
cycloalkenyl, and is itself either unsubstituted
or substituted with an alkyl, alkenyl,
cycloalkyl or cycloalkenyl group;
R₂, R₃, R₄ and R₅ are independently hydrogen, alkyl,
alkenyl, cycloalkyl, cycloalkenyl, aralkyl,
aryl, amino, hydroxyl, 1-piperazine, 1-
piperidine, or 1-imidazoline, and are either
unsubstituted or substituted with a moiety
selected from the group consisting of alkyl,
alkenyl, alkoxy, phenoxy, benzyloxy, cycloalkyl,
cycloalkenyl, hydroxy, carboxy, carbonyl, amino,
amido, cyano, isocyano, nitro, nitroso, nitrilo,
isonitrilo, imino, azo, diazo, sulfonyl,
sulfoxy, thio, thiocarbonyl, sulfhydryl, halo,
haloalkyl, trifluoromethyl, aralkyl and aryl.

62. The composition of claim 61, wherein, when Y is
25 a fused, 6-membered, aromatic carbocyclic ring, and R₁, R₂,
R₃ and R₄ are each hydrogen, X is not a -COOH group.

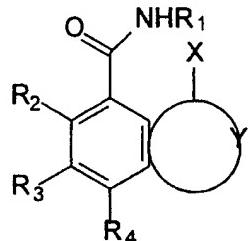

63. The composition of claim 61, wherein the compound is

64. The composition of claim 61, wherein the type of septic shock is endotoxic shock.

5

65. A pharmaceutical composition comprising a pharmaceutically acceptable carrier and a compound of formula I:

I

10

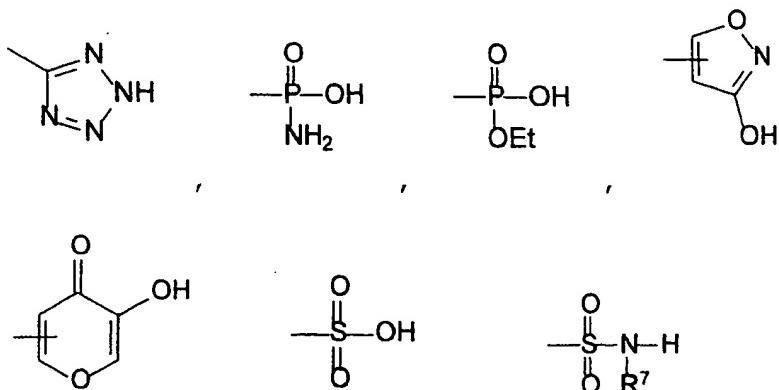

or a pharmaceutically acceptable salt, hydrate, ester, solvate, prodrug, metabolite, stereoisomer, or mixtures thereof, wherein the compound of formula I is present in an amount that is effective for treating cancer; and 15 wherein:

20

Y represents the atoms necessary to form a fused 5- to 6-membered, aromatic or non-aromatic, carbocyclic or N-containing heterocyclic ring, wherein Y and any heteroatom(s) therein are unsubstituted or independently substituted with at least one non-interfering alkyl, alkenyl, cycloalkyl, cycloalkenyl, aralkyl, aryl, carboxy or halo substituent;

25

X is at the 1-position of ring Y and is $-\text{COOR}_5$ or a substituted or unsubstituted moiety selected from the group consisting of

and , wherein R⁷ is

hydrogen, alkyl, alkenyl, cycloalkyl or cyclo-
5 alkenyl, and is itself either unsubstituted or
substituted with an alkyl, alkenyl, cycloalkyl
or cycloalkenyl group;

R₁ is hydrogen, alkyl, alkenyl, cycloalkyl or
cycloalkenyl, and is itself either unsubstituted
10 or substituted with an alkyl, alkenyl,
cycloalkyl or cycloalkenyl group;

R₂, R₃, R₄ and R₅ are independently hydrogen, alkyl,
alkenyl, cycloalkyl, cycloalkenyl, aralkyl,
aryl, amino, hydroxyl, 1-piperazine, 1-
15 piperidine, or 1-imidazoline, and are either
unsubstituted or substituted with a moiety
selected from the group consisting of alkyl,
alkenyl, alkoxy, phenoxy, benzyloxy, cycloalkyl,
cycloalkenyl, hydroxy, carboxy, carbonyl, amino,
amido, cyano, isocyano, nitro, nitroso, nitrilo,
20 isonitrilo, imino, azo, diazo, sulfonyl,
sulfoxy, thio, thiocarbonyl, sulphydryl, halo,
haloalkyl, trifluoromethyl, aralkyl and aryl.

25 66. The composition of claim 65, wherein when Y is a
fused, 6-membered, aromatic carbocyclic ring, and R₁, R₂,
R₃ and R₄ are each hydrogen, X is not a -COOH group.

67. The composition of claim 65, wherein the

compound is

68. The composition of claim 65, wherein the cancer
5 is selected from the group consisting of ACTH-producing
tumors, acute lymphocytic leukemia, acute nonlymphocytic
leukemia, cancer of the adrenal cortex, bladder cancer,
brain cancer, breast cancer, cervix cancer, chronic
lymphocytic leukemia, chronic myelocytic leukemia,
10 colorectal cancer, cutaneous T-cell lymphoma, endometrial
cancer, esophageal cancer, Ewing's sarcoma, gallbladder
cancer, hairy cell leukemia, head & neck cancer, Hodgkin's
lymphoma, Kaposi's sarcoma, kidney cancer, liver cancer,
lung cancer (small and/or non-small cell), malignant
15 peritoneal effusion, malignant pleural effusion, melanoma,
mesothelioma, multiple myeloma, neuroblastoma, non-
Hodgkin's lymphoma, osteosarcoma, ovary cancer, ovary
(germ cell) cancer, prostate cancer, pancreatic cancer,
penis cancer, retinoblastoma, skin cancer, soft-tissue
20 sarcoma, squamous cell carcinomas, stomach cancer,
testicular cancer, thyroid cancer, trophoblastic
neoplasms, cancer of the uterus, vaginal cancer, cancer of
the vulva and Wilm's tumor.

- 25 69. The composition of claim 65, wherein the carrier
comprises a biodegradable polymer.

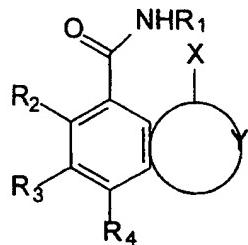

70. The composition of claim 69, wherein the
composition is a solid implant.

30

71. The composition of claim 69, wherein the
biodegradable polymer releases the compound of formula I

over a prolonged period of time.

72. A pharmaceutical composition comprising a pharmaceutically acceptable carrier and a compound of 5 formula I:

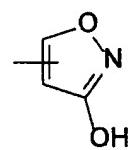

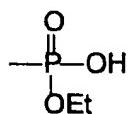

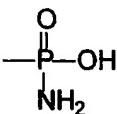

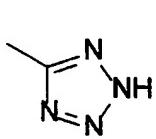

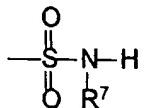

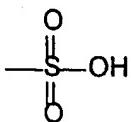

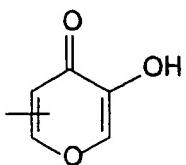

I

or a pharmaceutically acceptable salt, hydrate, ester, solvate, prodrug, metabolite, stereoisomer, or mixtures 10 thereof, wherein the compound of formula I is present in an amount that is effective for radiosensitizing tumor cells; and wherein:

Y represents the atoms necessary to form a fused 5-
to 6-membered, aromatic or non-aromatic,
15 carbocyclic or N-containing heterocyclic ring,
wherein Y and any heteroatom(s) therein are
unsubstituted or independently substituted with
at least one non-interfering alkyl, alkenyl,
cycloalkyl, cycloalkenyl, aralkyl, aryl, carboxy
20 or halo substituent;

X is at the 1-position of ring Y and is -COOR₅ or a
substituted or unsubstituted moiety selected
from the group consisting of

, and ,

wherein R⁷ is hydrogen, alkyl, alkenyl, cycloalkyl or cycloalkenyl, and is itself either unsubstituted or substituted with an alkyl, alkenyl, cycloalkyl or cycloalkenyl group;

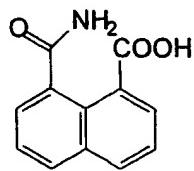

R₁ is hydrogen, alkyl, alkenyl, cycloalkyl or cycloalkenyl, and is itself either unsubstituted or substituted with an alkyl, alkenyl, cycloalkyl or cycloalkenyl group;

R₂, R₃, R₄ and R₅ are independently hydrogen, alkyl, alkenyl, cycloalkyl, cycloalkenyl, aralkyl, aryl, amino, hydroxyl, 1-piperazine, 1-piperidine, or 1-imidazoline, and are either

unsubstituted or substituted with a moiety selected from the group consisting of alkyl, alkenyl, alkoxy, phenoxy, benzyloxy, cycloalkyl, cycloalkenyl, hydroxy, carboxy, carbonyl, amino, amido, cyano, isocyano, nitro, nitroso, nitrilo, isonitrilo, imino, azo, diazo, sulfonyl, sulfoxy, thio, thiocarbonyl, sulfhydryl, halo, haloalkyl, trifluoromethyl, aralkyl and aryl.

73. The composition of claim 72, wherein when Y is a fused, 6-membered, aromatic carbocyclic ring, and R₁, R₂, R₃ and R₄ are each hydrogen, X is not a -COOH group.

74. The composition of claim 72, wherein the compound is

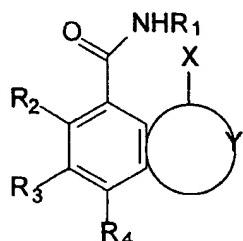

75. The composition of claim 72, wherein said tumor cells are selected from the group consisting of ACTH-producing tumors, acute lymphocytic leukemia, acute nonlymphocytic leukemia, cancer of the adrenal cortex, bladder cancer, brain cancer, breast cancer, cervix cancer, chronic lymphocytic leukemia, chronic myelocytic leukemia, colorectal cancer, cutaneous T-cell lymphoma, 10 endometrial cancer, esophageal cancer, Ewing's sarcoma, gallbladder cancer, hairy cell leukemia, head & neck cancer, Hodgkin's lymphoma, Kaposi's sarcoma, kidney cancer, liver cancer, lung cancer (small and/or non-small cell), malignant peritoneal effusion, malignant pleural 15 effusion, melanoma, mesothelioma, multiple myeloma, neuroblastoma, non-Hodgkin's lymphoma, osteosarcoma, ovary cancer, ovary (germ cell) cancer, prostate cancer, pancreatic cancer, penis cancer, retinoblastoma, skin cancer, soft-tissue sarcoma, squamous cell carcinomas, 20 stomach cancer, testicular cancer, thyroid cancer, trophoblastic neoplasms, cancer of the uterus, vaginal cancer, cancer of the vulva and Wilm's tumor.

76. The composition of claim 72, wherein the carrier 25 comprises a biodegradable polymer.

77. The composition of claim 76, wherein the composition is a solid implant.

30 78. The composition of claim 76, wherein the biodegradable polymer releases the compound of formula I over a prolonged period of time.

79. A method of inhibiting PARP activity comprising administering a compound of formula I:

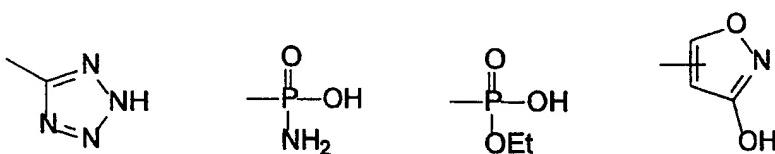

I

5

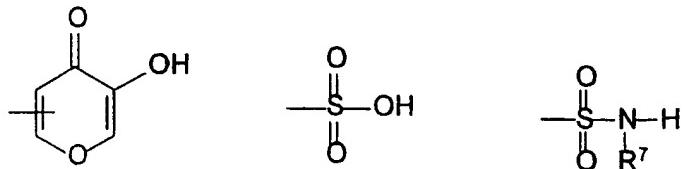

or a pharmaceutically acceptable salt, hydrate, ester, solvate, prodrug, metabolite, stereoisomer, or mixtures thereof; wherein:

Y represents the atoms necessary to form a fused 5-
10 to 6-membered, aromatic or non-aromatic, carbocyclic or N-containing heterocyclic ring, wherein Y and any heteroatom(s) therein are unsubstituted or independently substituted with at least one non-interfering alkyl, alkenyl, cycloalkyl, cycloalkenyl, aralkyl, aryl, carboxy or halo substituent;

X is at the 1-position of ring Y and is -COOR₅ or a substituted or unsubstituted moiety selected from the group consisting of

20

, and , wherein R⁷ is

hydrogen, alkyl, alkenyl, cycloalkyl or cyclo-

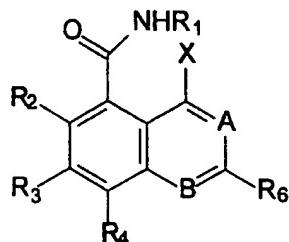

alkenyl, and is itself either unsubstituted or substituted with an alkyl, alkenyl, cycloalkyl or cycloalkenyl group;

R₁ is hydrogen, alkyl, alkenyl, cycloalkyl or cycloalkenyl, and is itself either unsubstituted or substituted with an alkyl, alkenyl, cycloalkyl or cycloalkenyl group;

R₂, R₃, R₄ and R₅ are independently hydrogen, alkyl, alkenyl, cycloalkyl, cycloalkenyl, aralkyl, aryl, amino, hydroxyl, 1-piperazine, 1-piperidine, or 1-imidazoline, and are either unsubstituted or substituted with a moiety selected from the group consisting of alkyl, alkenyl, alkoxy, phenoxy, benzyloxy, cycloalkyl, cycloalkenyl, hydroxy, carboxy, carbonyl, amino, amido, cyano, isocyano, nitro, nitroso, nitrilo, isonitrilo, imino, azo, diazo, sulfonyl, sulfoxy, thio, thiocarbonyl, sulfhydryl, halo, haloalkyl, trifluoromethyl, aralkyl and aryl.

20
80. The method of claim 79, wherein Y has at least one site of unsaturation.

81. The method of claim 79, wherein said compound
25 has formula II:

II

or a pharmaceutically acceptable salt, hydrate, ester, solvate, prodrug, metabolite, stereoisomer, or mixtures
30 thereof; wherein A and B are independently carbon or

nitrogen and are optionally and independently unsubstituted or substituted with alkyl, alkenyl, cycloalkyl, cycloalkenyl, aralkyl or aryl group; provided that at least one of A and B is nitrogen.

5

82. The method of claim 81 wherein, when Y is a fused, 6-membered, aromatic carbocyclic ring, and R₁, R₂, R₃ and R₄ are each hydrogen, X is not a -COOH group.

10

83. The method of claim 81, wherein the compound is

84. The method of claim 79, wherein Y represents the atoms necessary to form a fused benzene ring.

15

85. The method of claim 79, wherein said compound has an isoquinoline, a quinoline, a naphthalene, a phenanthridine, a phthalazine, a phthalhydrazide, or a quinazoline nucleus.

20

86. The method of claim 79, wherein said compound has an isoquinoline, a quinoline or a naphthalene nucleus.

25

87. The method of claim 79, wherein Y represents the atoms necessary to form a 5- to 6-membered carbocyclic ring.

88. The method of claim 87, wherein Y is aromatic.

30

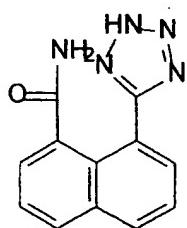

89. The method of claim 87, wherein Y is non-aromatic.

90. The method of claim 79, wherein Y represents the atoms necessary to form a 5- to 6-membered, N-containing heterocyclic ring.

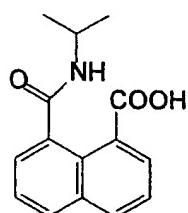

5 91. The method of claim 90, wherein Y is aromatic.

92. The method of claim 90, wherein Y is non-aromatic.

10 93. The method of claim 79, wherein the compound is selected from the group consisting of

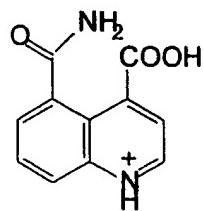

I

II

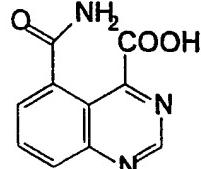

III

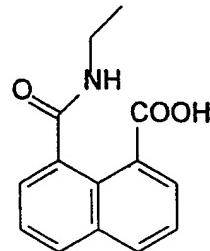

15

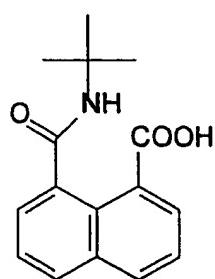

IV

V

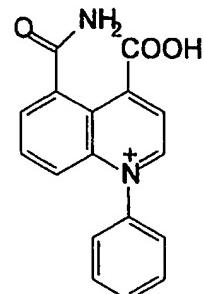

VI

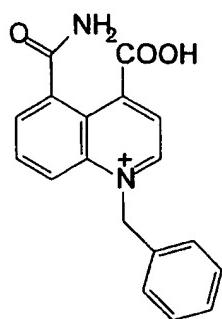

VII

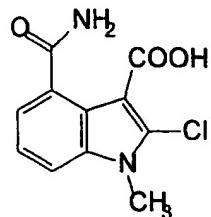

VIII

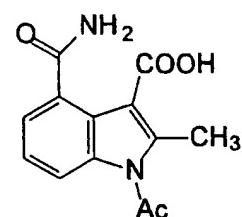

IX

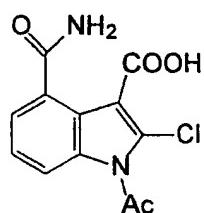

X

XI

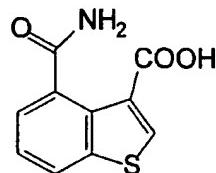

XII

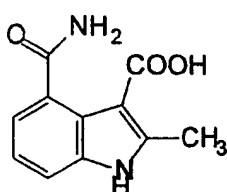

XIII

XIV

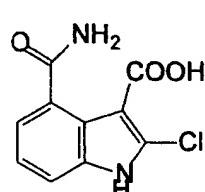

XV

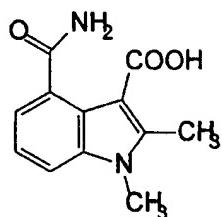

5

XVI

XVII

XVIII

and

XIX

10

94. The method of claim 79, wherein when Y is a fused, 6-membered, aromatic carbocyclic ring, and R₁, R₂, R₃ and R₄ are each hydrogen, X is not a -COOH group.

15

95. The method of claim 79, wherein the compound is

96. The method of claim 79, wherein said compound has an IC₅₀ of 100 µM or lower for inhibiting poly(ADP-ribose) polymerase in vitro.

5

97. The method of claim 79, wherein said compound has an IC₅₀ of 25 µM or lower for inhibiting poly(ADP-ribose) polymerase in vitro.

10 98. The method of claim 79, wherein said pharmaceutical composition is in a carrier comprising a biodegradable polymer.

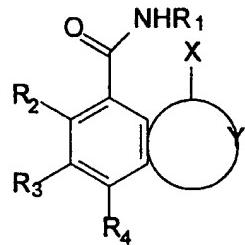

15 99. The method of claim 98, wherein the biodegradable polymer carrier is in the form of a solid implant.

100. The method of claim 98, wherein the biodegradable polymer releases the compound of formula I 20 over a prolonged period of time.

101. The method of claim 79 further comprising treating or preventing diseases or conditions selected from the group consisting of tissue damage resulting from 25 cell damage or death due to necrosis or apoptosis, neuronal mediated tissue damage or diseases, neural tissue damage resulting from ischemia and reperfusion injury, neurological disorders and neurodegenerative diseases, vascular stroke, cardiovascular disorders, age-related

macular degeneration, AIDS and other immune senescence diseases, arthritis, atherosclerosis, cachexia, cancer, degenerative diseases of skeletal muscle involving replicative senescence, diabetes, head trauma, immune 5 senescence, inflammatory bowel disorders, muscular dystrophy, osteoarthritis, osteoporosis, chronic pain, acute pain, neuropathic pain, nervous insult, peripheral nerve injury, renal failure, retinal ischemia, septic shock, and skin aging, diseases or disorders relating to 10 lifespan or proliferative capacity of cells, and diseases or disease conditions induced or exacerbated by cellular senescence.

102. A method of effecting a neuronal activity not 15 mediated by NMDA toxicity in an animal comprising administering to said animal an effective amount of a compound of formula I:

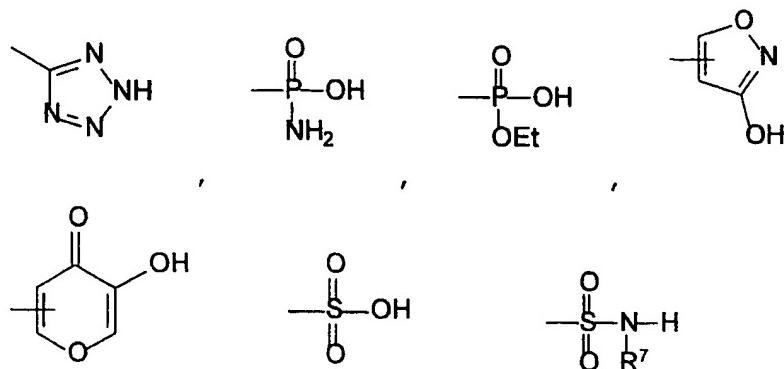

I

20 or a pharmaceutically acceptable salt, hydrate, ester, solvate, prodrug, metabolite, stereoisomer, or mixtures thereof; wherein:

Y represents the atoms necessary to form a fused 5-
to 6-membered, aromatic or non-aromatic,
25 carbocyclic or N-containing heterocyclic ring,
wherein Y and any heteroatom(s) therein are
unsubstituted or independently substituted with
at least one non-interfering alkyl, alkenyl,
cycloalkyl, cycloalkenyl, aralkyl, aryl, carboxy
30 or halo substituent;

X is at the 1-position of ring Y and is -COOR₅ or a

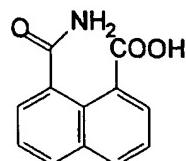

substituted or unsubstituted moiety selected from the group consisting of

- 5 , and , wherein R⁷ is hydrogen, alkyl, alkenyl, cycloalkyl or cycloalkenyl, and is itself either unsubstituted or substituted with an alkyl, alkenyl, cycloalkyl or cycloalkenyl group;
- 10 R₁ is hydrogen, alkyl, alkenyl, cycloalkyl or cycloalkenyl, and is itself either unsubstituted or substituted with an alkyl, alkenyl, cycloalkyl or cycloalkenyl group;
- R₂, R₃, R₄ and R₅ are independently hydrogen, alkyl, alkenyl, cycloalkyl, cycloalkenyl, aralkyl, aryl, amino, hydroxyl, 1-piperazine, 1-piperidine, or 1-imidazoline, and are either unsubstituted or substituted with a moiety selected from the group consisting of alkyl,
- 15 alkenyl, alkoxy, phenoxy, benzyloxy, cycloalkyl, cycloalkenyl, hydroxy, carboxy, carbonyl, amino, amido, cyano, isocyano, nitro, nitroso, nitrilo, isonitrilo, imino, azo, diazo, sulfonyl, sulfoxy, thio, thiocarbonyl, sulfhydryl, halo, haloalkyl, trifluoromethyl, aralkyl and aryl.
- 20
- 25

103. The method of claim 102, wherein when Y is a fused, 6-membered, aromatic carbocyclic ring, and R₁, R₂, R₃ and R₄ are each hydrogen, X is not a -COOH group.

104. The method of claim 102, wherein the compound is

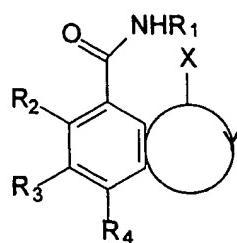

105. The method of claim 102, wherein the neuronal
5 activity is selected from the group consisting of
stimulation of damaged neurons, promotion of neuronal
regeneration, prevention of neurodegeneration, and
treatment of a neurological disorder.

10 106. The method of claim 105, wherein said damaged
neurons result from cerebral ischemia or reperfusion
injury.

107. The method of claim 105, wherein the
15 neurological disorder is selected from the group
consisting of peripheral neuropathy caused by physical
injury or disease state, traumatic brain injury, physical
damage to the spinal cord, stroke associated with brain
damage, demyelinating disease and neurological disorder
20 relating to neurodegeneration.

108. The method of claim 107, wherein the
neurological disorder relating to neurodegeneration is
selected from the group consisting of Alzheimer's Disease,
25 Parkinson's Disease, Huntington's Disease and amyotrophic
lateral sclerosis.

109. A method of treating arthritis in an animal
comprising administering to said animal an effective
30 amount of a compound of formula I:

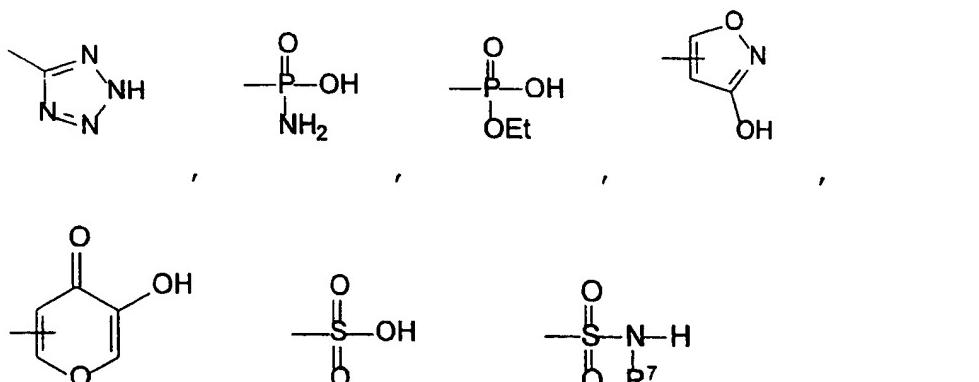

I

or a pharmaceutically acceptable salt, hydrate, ester, solvate, prodrug, metabolite, stereoisomer, or mixtures thereof; wherein:

Y represents the atoms necessary to form a fused 5-
to 6-membered, aromatic or non-aromatic,
carbocyclic or N-containing heterocyclic ring,
wherein Y and any heteroatom(s) therein are
10 unsubstituted or independently substituted with
at least one non-interfering alkyl, alkenyl,
cycloalkyl, cycloalkenyl, aralkyl, aryl, carboxy
or halo substituent;

X is at the 1-position of ring Y and is -COOR₅ or a
15 substituted or unsubstituted moiety selected
from the group consisting of

20 and , wherein R' is
hydrogen, alkyl, alkenyl, cycloalkyl or cycloalkenyl, and is itself either unsubstituted or substituted with an alkyl, alkenyl, cycloalkyl or cycloalkenyl group;

R₁ is hydrogen, alkyl, alkenyl, cycloalkyl or cycloalkenyl, and is itself either unsubstituted or substituted with an alkyl, alkenyl, cycloalkyl or cycloalkenyl group;

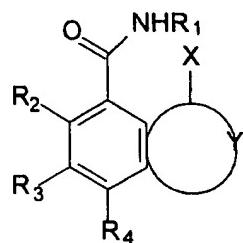

5 R₂, R₃, R₄ and R₅ are independently hydrogen, alkyl, alkenyl, cycloalkyl, cycloalkenyl, aralkyl, aryl, amino, hydroxyl, 1-piperazine, 1-piperidine, or 1-imidazoline, and are either unsubstituted or substituted with a moiety
10 selected from the group consisting of alkyl, alkenyl, alkoxy, phenoxy, benzyloxy, cycloalkyl, cycloalkenyl, hydroxy, carboxy, carbonyl, amino, amido, cyano, isocyano, nitro, nitroso, nitrilo, isonitrilo, imino, azo, diazo, sulfonyl,
15 sulfoxy, thio, thiocarbonyl, sulfhydryl, halo, haloalkyl, trifluoromethyl, aralkyl and aryl.

110. The method of claim 109, wherein when Y is a fused, 6-membered, aromatic carbocyclic ring, and R₁, R₂,
20 R₃ and R₄ are each hydrogen, X is not a -COOH group.

111. The method of claim 109, wherein the compound is

25 112. A method of treating diabetes in an animal comprising administering to said animal an effective amount of a compound of formula I:

I

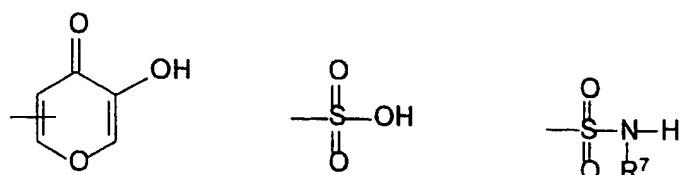

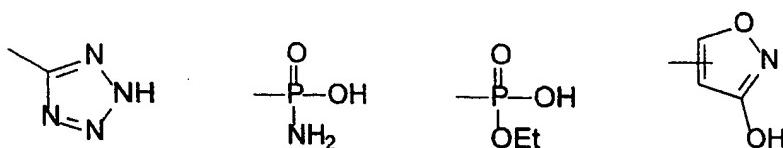

or a pharmaceutically acceptable salt, hydrate, ester, solvate, prodrug, metabolite, stereoisomer, or mixtures thereof; wherein:

10

Y represents the atoms necessary to form a fused 5- to 6-membered, aromatic or non-aromatic, carbocyclic or N-containing heterocyclic ring, wherein Y and any heteroatom(s) therein are unsubstituted or independently substituted with at least one non-interfering alkyl, alkenyl, cycloalkyl, cycloalkenyl, aralkyl, aryl, carboxy or halo substituent;

15

X is at the 1-position of ring Y and is $-COOR_5$ or a substituted or unsubstituted moiety selected from the group consisting of

20

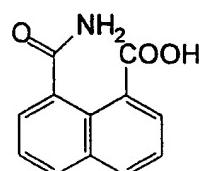

and , wherein R^7 is hydrogen, alkyl, alkenyl, cycloalkyl or cycloalkenyl, and is itself either unsubstituted or substituted with an alkyl, alkenyl, cycloalkyl or cycloalkenyl group;

R₁ is hydrogen, alkyl, alkenyl, cycloalkyl or cycloalkenyl, and is itself either unsubstituted or substituted with an alkyl, alkenyl, cycloalkyl or cycloalkenyl group;

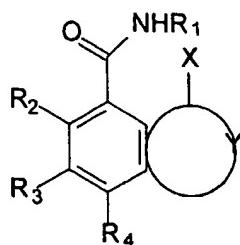

5 R₂, R₃, R₄ and R₅ are independently hydrogen, alkyl, alkenyl, cycloalkyl, cycloalkenyl, aralkyl, aryI, amino, hydroxyl, 1-piperazine, 1-piperidine, or 1-imidazoline, and are either unsubstituted or substituted with a moiety
10 selected from the group consisting of alkyl, alkenyl, alkoxy, phenoxy, benzyloxy, cycloalkyl, cycloalkenyl, hydroxy, carboxy, carbonyl, amino, amido, cyano, isocyano, nitro, nitroso, nitrilo, isonitrilo, imino, azo, diazo, sulfonyl,
15 sulfoxy, thio, thiocarbonyl, sulfhydryl, halo, haloalkyl, trifluoromethyl, aralkyl and aryl.

113. The method of claim 112, wherein when Y is a fused, 6-membered, aromatic, carbocyclic ring, and R₁, R₂,
20 R₃, and R₄ are each hydrogen, X is not a -COOH group.

114. The method of claim 112, wherein the compound is

25 115. A method of treating an inflammatory bowel disorder in an animal comprising administering to said animal an effective amount of a compound of formula I:

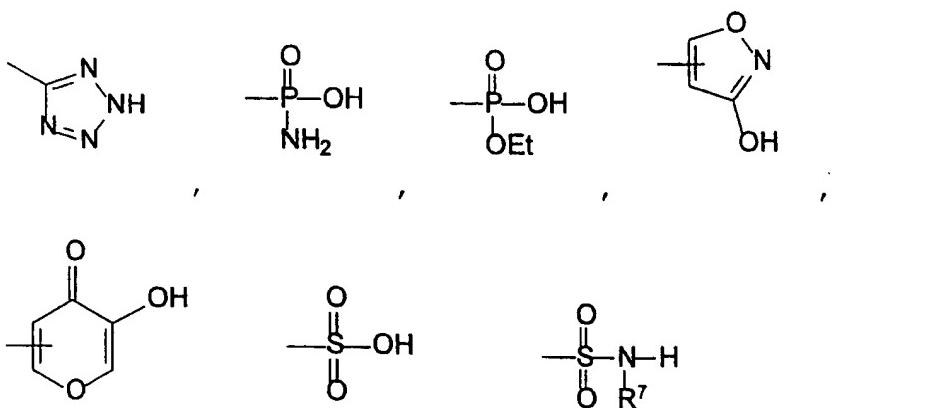

I

or a pharmaceutically acceptable salt, hydrate, ester, solvate, prodrug, metabolite, stereoisomer, or mixtures 5 thereof; wherein:

Y represents the atoms necessary to form a fused 5-
to 6-membered, aromatic or non-aromatic,
carbocyclic or N-containing heterocyclic ring,
wherein Y and any heteroatom(s) therein are
10 unsubstituted or independently substituted with
at least one non-interfering alkyl, alkenyl,
cycloalkyl, cycloalkenyl, aralkyl, aryl, carboxy
or halo substituent;

X is at the 1-position of ring Y and is -COOR₅ or a
15 substituted or unsubstituted moiety selected
from the group consisting of

20 hydrogen, alkyl, alkenyl, cycloalkyl or cyclo-
alkenyl, and is itself either unsubstituted or
substituted with an alkyl, alkenyl, cycloalkyl

or cycloalkenyl group;

R₁ is hydrogen, alkyl, alkenyl, cycloalkyl or cycloalkenyl, and is itself either unsubstituted or substituted with an alkyl, alkenyl, 5 cycloalkyl or cycloalkenyl group;

R₂, R₃, R₄ and R₅ are independently hydrogen, alkyl, alkenyl, cycloalkyl, cycloalkenyl, aralkyl, 10 aryl, amino, hydroxyl, 1-piperazine, 1-piperidine, or 1-imidazoline, and are either

15 unsubstituted or substituted with a moiety selected from the group consisting of alkyl, alkenyl, alkoxy, phenoxy, benzyloxy, cycloalkyl, cycloalkenyl, hydroxy, carboxy, carbonyl, amino, amido, cyano, isocyano, nitro, nitroso, nitrilo, isonitrilo, imino, azo, diazo, sulfonyl, 20 sulfoxy, thio, thiocarbonyl, sulfhydryl, halo, haloalkyl, trifluoromethyl, aralkyl and aryl.

116. The method of claim 115 wherein, when Y is a fused, 6-membered, aromatic carbocyclic ring, and R₁, R₂, R₃ and R₄ are each hydrogen, X is not a -COOH group.

117. The method of claim 115, wherein the compound is

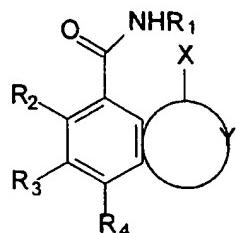

25

118. The method of claim 115, wherein the bowel disorder is colitis.

119. The method of claim 115, wherein the bowel 30 disorder is Crohn's disease.

120. A method of treating a cardiovascular disorder

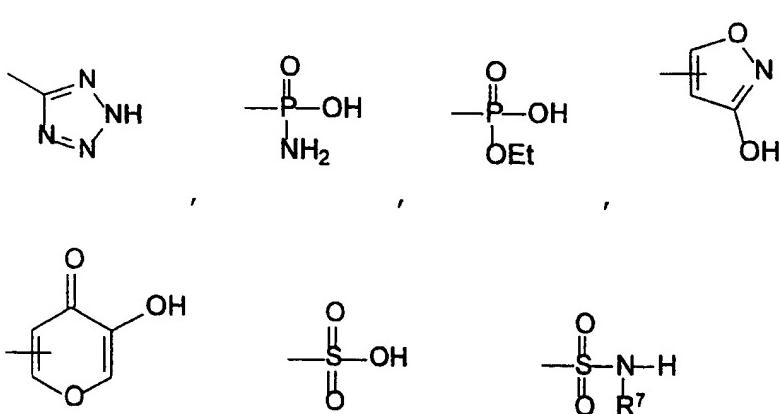

in an animal comprising administering to said animal an effective amount of a compound of formula I:

I

5 or a pharmaceutically acceptable salt, hydrate, ester, solvate, prodrug, metabolite, stereoisomer, or mixtures thereof; wherein:

- Y represents the atoms necessary to form a fused 5-
to 6-membered, aromatic or non-aromatic,
10 carbocyclic or N-containing heterocyclic ring,
wherein Y and any heteroatom(s) therein are
unsubstituted or independently substituted with
at least one non-interfering alkyl, alkenyl,
cycloalkyl, cycloalkenyl, aralkyl, aryl, carboxy
15 or halo substituent;
- X is at the 1-position of ring Y and is -COOR₅ or a
substituted or unsubstituted moiety selected
from the group consisting of

substituted with an alkyl, alkenyl, cycloalkyl or cycloalkenyl group;

5 R₁ is hydrogen, alkyl, alkenyl, cycloalkyl or cycloalkenyl, and is itself either unsubstituted or substituted with an alkyl, alkenyl, cycloalkyl or cycloalkenyl group;

R₂, R₃, R₄ and R₅ are independently hydrogen, alkyl, alkenyl, cycloalkyl, cycloalkenyl, aralkyl, 10 aryl, amino, hydroxyl, 1-piperazine, 1-piperidine, or 1-imidazoline, and are either unsubstituted or substituted with a moiety selected from the group consisting of alkyl, alkenyl, alkoxy, phenoxy, benzyloxy, cycloalkyl, cycloalkenyl, hydroxy, carboxy, carbonyl, amino, 15 amido, cyano, isocyano, nitro, nitroso, nitrilo, isonitrilo, imino, azo, diazo, sulfonyl, sulfoxy, thio, thiocarbonyl, sulfhydryl, halo, haloalkyl, trifluoromethyl, aralkyl and aryl.

20 121. The method of claim 120 wherein, when Y is a fused, 6-membered, aromatic carbocyclic ring, and R₁, R₂, R₃ and R₄ are each hydrogen, X is not a -COOH group.

122. The method of claim 120, wherein the compound is

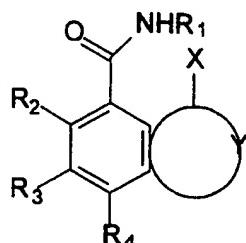

25

123. The method of claim 120, wherein the cardiovascular disorder is coronary artery disease, myocardial infarction, angina pectoris, cardiogenic shock 30 and cardiovascular tissue damage.

124. A method of treating septic shock in an animal

comprising administering to said animal an effective amount of a compound of formula I:

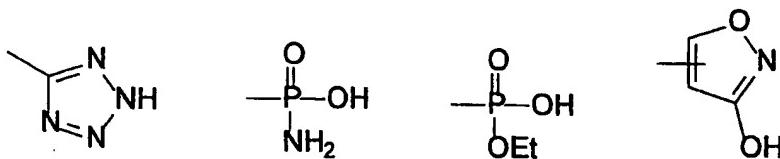

I

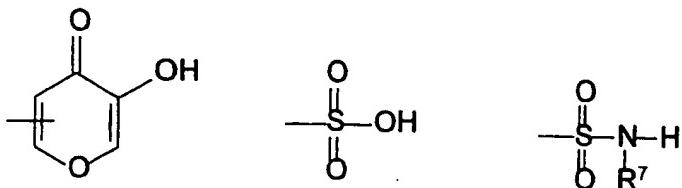

5

or a pharmaceutically acceptable salt, hydrate, ester, solvate, prodrug, metabolite, stereoisomer, or mixtures thereof; wherein:

Y represents the atoms necessary to form a fused 5-
10 to 6-membered, aromatic or non-aromatic, carbocyclic or N-containing heterocyclic ring, wherein Y and any heteroatom(s) therein are unsubstituted or independently substituted with at least one non-interfering alkyl, alkenyl, cycloalkyl, cycloalkenyl, aralkyl, aryl, carboxy or halo substituent;
15 X is at the 1-position of ring Y and is -COOR₅ or a substituted or unsubstituted moiety selected from the group consisting of

20

and , wherein R⁷ is

hydrogen, alkyl, alkenyl, cycloalkyl or cycloalkenyl, and is itself either unsubstituted or substituted with an alkyl, alkenyl, cycloalkyl or cycloalkenyl group;

5 R₁ is hydrogen, alkyl, alkenyl, cycloalkyl or cycloalkenyl, and is itself either unsubstituted or substituted with an alkyl, alkenyl, cycloalkyl or cycloalkenyl group;

R₂, R₃, R₄ and R₅ are independently hydrogen, alkyl, alkenyl, cycloalkyl, cycloalkenyl, aralkyl, 10 aryl, amino, hydroxyl, 1-piperazine, 1-piperidine, or 1-imidazoline, and are either unsubstituted or substituted with a moiety selected from the group consisting of alkyl, alkenyl, alkoxy, phenoxy, benzyloxy, cycloalkyl, cycloalkenyl, hydroxy, carboxy, carbonyl, amino, amido, cyano, isocyano, nitro, nitroso, nitrilo, isonitrilo, imino, azo, diazo, sulfonyl, sulfoxy, thio, thiocarbonyl, sulfhydryl, halo, 15 haloalkyl, trifluoromethyl, aralkyl and aryl,

20

125. The method of claim 124, wherein when Y is a fused, 6-membered, aromatic carbocyclic ring, and R₁, R₂, R₃, and R₄ are each hydrogen, X is not a -COOH group.

25

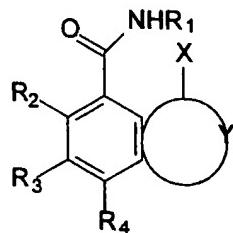

126. The method of claim 124, wherein the compound is

127. The method of claim 124, wherein the type of 30 septic shock is endotoxic shock.

128. A method of treating cancer in an animal

comprising administering to said animal an effective amount of a compound of formula I:

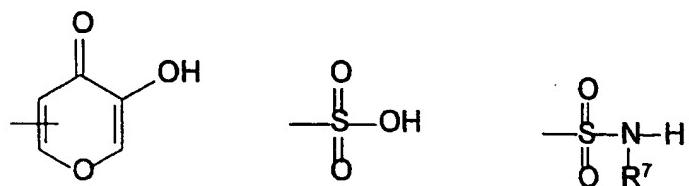

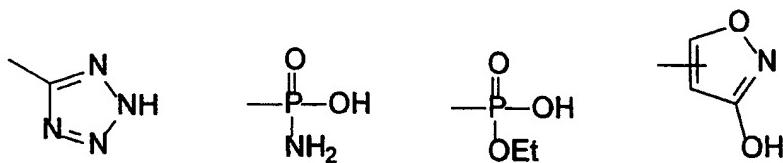

I

5 or a pharmaceutically acceptable salt, hydrate, ester, solvate, prodrug, metabolite, stereoisomer, or mixtures thereof; wherein:

Y represents the atoms necessary to form a fused 5-
to 6-membered, aromatic or non-aromatic,
10 carbocyclic or N-containing heterocyclic ring,
wherein Y and any heteroatom(s) therein are
unsubstituted or independently substituted with
at least one non-interfering alkyl, alkenyl,
cycloalkyl, cycloalkenyl, aralkyl, aryl, carboxy
15 or halo substituent;

X is at the 1-position of ring Y and is -COOR₅ or a
substituted or unsubstituted moiety selected
from the group consisting of

20 and , wherein R' is
hydrogen, alkyl, alkenyl, cycloalkyl or

cycloalkenyl, and is itself either unsubstituted or substituted with an alkyl, alkenyl, cycloalkyl or cycloalkenyl group;

R₁ is hydrogen, alkyl, alkenyl, cycloalkyl or cycloalkenyl, and is itself either unsubstituted or substituted with an alkyl, alkenyl, cycloalkyl or cycloalkenyl group;

R₂, R₃, R₄ and R₅ are independently hydrogen, alkyl, alkenyl, cycloalkyl, cycloalkenyl, aralkyl, aryl, amino, hydroxyl, 1-piperazine, 1-piperidine, or 1-imidazoline, and are either unsubstituted or substituted with a moiety selected from the group consisting of alkyl, alkenyl, alkoxy, phenoxy, benzyloxy, cycloalkyl, cycloalkenyl, hydroxy, carboxy, carbonyl, amino, amido, cyano, isocyano, nitro, nitroso, nitrilo, isonitrilo, imino, azo, diazo, sulfonyl, sulfoxy, thio, thiocarbonyl, sulfhydryl, halo, haloalkyl, trifluoromethyl, aralkyl and aryl.

20

129. The method of claim 128 wherein, when Y is a fused, 6-membered, aromatic carbocyclic ring, and R₁, R₂, R₃ and R₄ are each hydrogen, X is not a -COOH group.

25

130. The method of claim 128, wherein the compound is

131. The method of claim 128, wherein the cancer is selected from the group consisting of ACTH-producing tumors, acute lymphocytic leukemia, acute nonlymphocytic leukemia, cancer of the adrenal cortex, bladder cancer, brain cancer, breast cancer, cervix cancer, chronic

lymphocytic leukemia, chronic myelocytic leukemia, colorectal cancer, cutaneous T-cell lymphoma, endometrial cancer, esophageal cancer, Ewing's sarcoma, gallbladder cancer, hairy cell leukemia, head & neck cancer, Hodgkin's 5 lymphoma, Kaposi's sarcoma, kidney cancer, liver cancer, lung cancer (small and/or non-small cell), malignant peritoneal effusion, malignant pleural effusion, melanoma, mesothelioma, multiple myeloma, neuroblastoma, non-Hodgkin's lymphoma, osteosarcoma, ovary cancer, ovary 10 (germ cell) cancer, prostate cancer, pancreatic cancer, penis cancer, retinoblastoma, skin cancer, soft-tissue sarcoma, squamous cell carcinomas, stomach cancer, testicular cancer, thyroid cancer, trophoblastic neoplasms, cancer of the uterus, vaginal cancer, cancer of 15 the vulva and Wilm's tumor.

132. The method of claim 128, wherein said pharmaceutical composition is in a carrier comprising a biodegradable polymer.

20

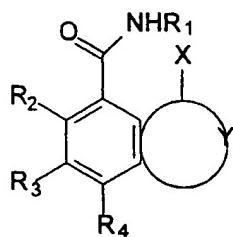

133. The method of claim 132, wherein the biodegradable polymer carrier is in the form of a solid implant.

25

134. The method of claim 132, wherein the biodegradable polymer releases the compound of formula I over a prolonged period of time.

30

135. A method of radiosensitizing tumor cells comprising administering an effective amount of a compound of formula I:

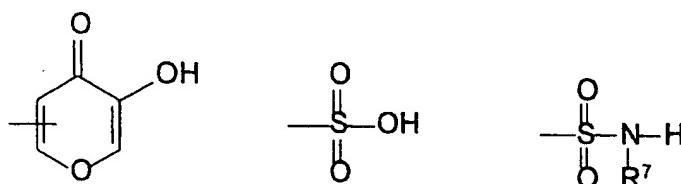

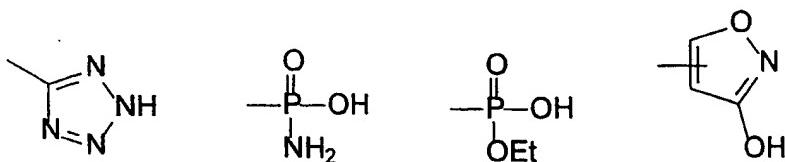

I

or a pharmaceutically acceptable salt, hydrate, ester, solvate, prodrug, metabolite, stereoisomer, or mixtures thereof; wherein:

Y represents the atoms necessary to form a fused 5- to 6-membered, aromatic or non-aromatic, carbocyclic or N-containing heterocyclic ring, wherein Y and any heteroatom(s) therein are unsubstituted or independently substituted with at least one non-interfering alkyl, alkenyl, cycloalkyl, cycloalkenyl, aralkyl, aryl, carboxy or halo substituent;

X is at the 1-position of ring Y and is -COOR₅ or a substituted or unsubstituted moiety selected from the group consisting of

and , wherein R⁷ is hydrogen, alkyl, alkenyl, cycloalkyl or cycloalkenyl, and is itself either unsubstituted or substituted with an alkyl, alkenyl,

cycloalkyl or cycloalkenyl group;

R₁ is hydrogen, alkyl, alkenyl, cycloalkyl or cyclo-
alkenyl, and is itself either unsubstituted or
substituted with an alkyl, alkenyl, cycloalkyl
or cycloalkenyl group;

R₂, R₃, R₄ and R₅ are independently hydrogen, alkyl,
alkenyl, cycloalkyl, cycloalkenyl, aralkyl,
aryl, amino, hydroxyl, 1-piperazine, 1-
piperidine, or 1-imidazoline, and are either
unsubstituted or substituted with a moiety
selected from the group consisting of alkyl,
alkenyl, alkoxy, phenoxy, benzyloxy, cycloalkyl,
cycloalkenyl, hydroxy, carboxy, carbonyl, amino,
amido, cyano, isocyano, nitro, nitroso, nitrilo,
isonitrilo, imino, azo, diazo, sulfonyl,
sulfoxy, thio, thiocarbonyl, sulfhydryl, halo,
haloalkyl, trifluoromethyl, aralkyl and aryl.

136. The method of claim 135 wherein, when Y is a
fused, 6-membered, aromatic carbocyclic ring, and R₁, R₂,
R₃ and R₄ are each hydrogen, X is not a -COOH group.

137. The method of claim 135, wherein the compound is

25

138. The method of claim 135, wherein said tumor
cells are selected from the group consisting of ACTH-
producing tumors, acute lymphocytic leukemia, acute
nonlymphocytic leukemia, cancer of the adrenal cortex,
bladder cancer, brain cancer, breast cancer, cervix
cancer, chronic lymphocytic leukemia, chronic myelocytic
leukemia, colorectal cancer, cutaneous T-cell lymphoma,

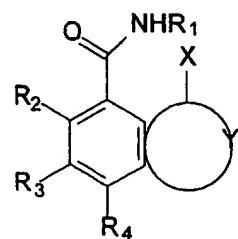

endometrial cancer, esophageal cancer, Ewing's sarcoma, gallbladder cancer, hairy cell leukemia, head & neck cancer, Hodgkin's lymphoma, Kaposi's sarcoma, kidney cancer, liver cancer, lung cancer (small and/or non-small cell), malignant peritoneal effusion, malignant pleural effusion, melanoma, mesothelioma, multiple myeloma, neuroblastoma, non-Hodgkin's lymphoma, osteosarcoma, ovary cancer, ovary (germ cell) cancer, prostate cancer, pancreatic cancer, penis cancer, retinoblastoma, skin cancer, soft-tissue sarcoma, squamous cell carcinomas, stomach cancer, testicular cancer, thyroid cancer, trophoblastic neoplasms, cancer of the uterus, vaginal cancer, cancer of the vulva and Wilm's tumor.

15 139. The method of claim 135, wherein said pharmaceutical composition is in a carrier comprising a biodegradable polymer.

20 140. The method of claim 139, wherein the biodegradable polymer carrier is in the form of a solid implant.

25 141. The method of claim 139, wherein the biodegradable polymer releases the compound of formula I over a prolonged period of time.

142. A process of making the compound of formula I:

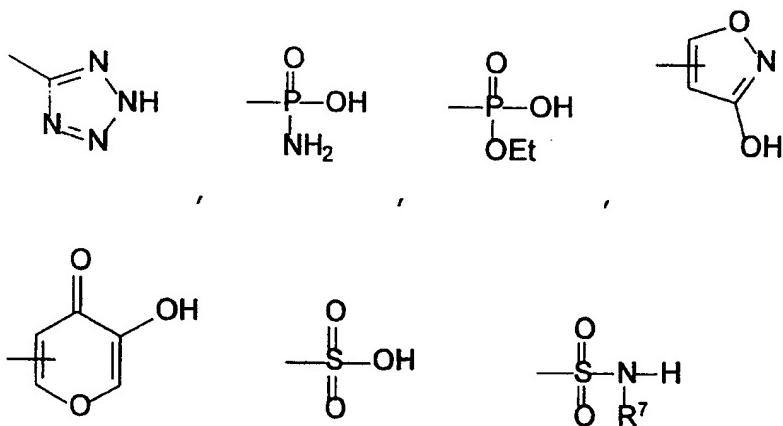

I

30 or a pharmaceutically acceptable salt, hydrate, ester, solvate, prodrug, metabolite, stereoisomer, or mixtures

thereof; wherein:

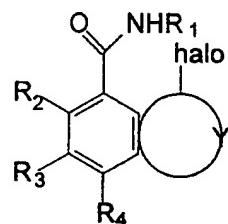

Y represents the atoms necessary to form a fused 5-
to 6- membered, aromatic or non-aromatic,
carbocyclic or N-containing heterocyclic ring,
wherein Y and any heteroatom(s) therein are
unsubstituted or independently substituted by at
least one non-interfering alkyl, alkenyl,
cycloalkyl, cycloalkenyl, benzyl or aryl;
X is at the 1-position of ring Y and is -COOR₅ or a
substituted or unsubstituted moiety selected
from the group consisting of

group consisting of alkyl, alkenyl, alkoxy, phenoxy, benzyloxy, cycloalkyl, cycloalkenyl, hydroxy, carboxy, carbonyl, amino, amido, cyano, isocyano, nitro, nitroso, nitrilo, isonitrilo, imino, azo, diazo, sulfonyl, sulfoxy, thio, thiocarbonyl, sulfhydryl, halo, haloalkyl, trifluoromethyl and aryl;

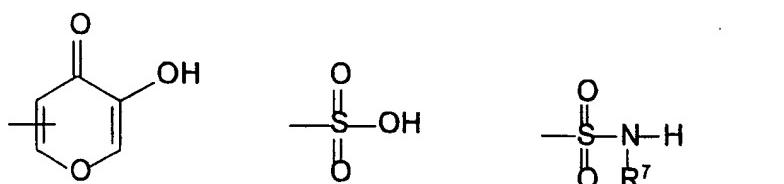

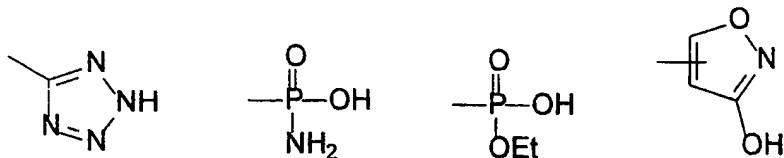

5 provided that, when Y is a fused, 6-membered, aromatic carbocyclic ring, and R₁, R₂, R₃, and R₄ are each hydrogen, X is not a -COOH group;

10 comprising the step of contacting an intermediate of formula III:

III

15 with a -COOR₅ radical or a substituted or unsubstituted radical selected from the group consisting of:

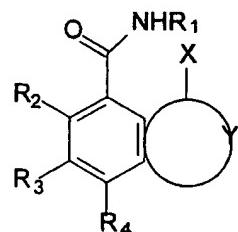

20 and wherein R⁷ is hydrogen, alkyl, alkenyl, cycloalkyl or cycloalkenyl, and is itself either unsubstituted or substituted with an alkyl, alkenyl, cycloalkyl

or cycloalkenyl group; and
 "halo" is chloro, bromo or iodo moiety.

143. The process of claim 142 wherein said R₅ is
 5 hydrogen or methyl.

144. A pharmaceutical composition comprising a pharmaceutically acceptable carrier and a compound of formula I:

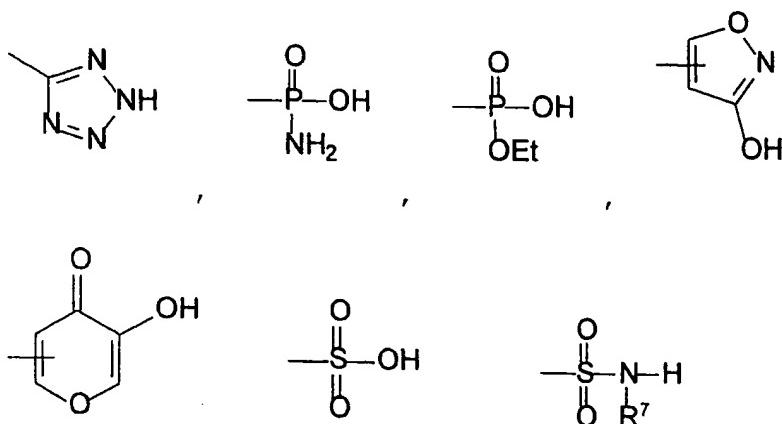

10

I

or a pharmaceutically acceptable salt, hydrate, ester, solvate, prodrug, metabolite, stereoisomer, or mixtures thereof, wherein the compound of formula I is present in
 15 an amount that is effective for treating ischemia; and
 wherein:

Y represents the atoms necessary to form a fused 5-
 to 6-membered, aromatic or non-aromatic,
 carbocyclic or N-containing heterocyclic ring,
 20 wherein Y and any heteroatom(s) therein are
 unsubstituted or independently substituted with
 at least one non-interfering alkyl, alkenyl,
 cycloalkyl, cycloalkenyl, aralkyl, aryl, carboxy
 or halo substituent;

25 X is at the 1-position of ring Y and is -COOR₅ or a
 substituted or unsubstituted moiety selected
 from the group consisting of

and , wherein R⁷ is

5 hydrogen, alkyl, alkenyl, cycloalkyl or cycloalkenyl, and is itself either unsubstituted or substituted with an alkyl, alkenyl, cycloalkyl or cycloalkenyl group;

10 R₁ is hydrogen, alkyl, alkenyl, cycloalkyl or cycloalkenyl, and is itself either unsubstituted or substituted with an alkyl, alkenyl, cycloalkyl or cycloalkenyl group;

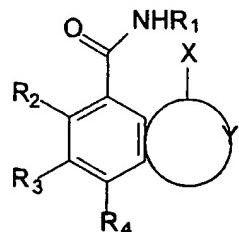

15 R₂, R₃, R₄ and R₅ are independently hydrogen, alkyl, alkenyl, cycloalkyl, cycloalkenyl, aralkyl, aryl, amino, hydroxyl, 1-piperazine, 1-piperidine, or 1-imidazoline, and are either unsubstituted or substituted with a moiety selected from the group consisting of alkyl, alkenyl, alkoxy, phenoxy, benzyloxy, cycloalkyl, cycloalkenyl, hydroxy, carboxy, carbonyl, amino, amido, cyano, isocyano, nitro, nitroso, nitrilo, isonitrilo, imino, azo, diazo, sulfonyl, sulfoxy, thio, thiocarbonyl, sulfhydryl, halo, haloalkyl, trifluoromethyl, aralkyl and aryl.

20 145. The composition of claim 144, wherein when Y is a fused, 6-membered, aromatic, carbocyclic ring, and R₁, R₂, R₃, and R₄ are each hydrogen, X is not a -COOH group.

146. The composition of claim 144, wherein the compound is

5 147. A method of treating ischemia in an animal comprising administering to said animal an effective amount of a compound of formula I:

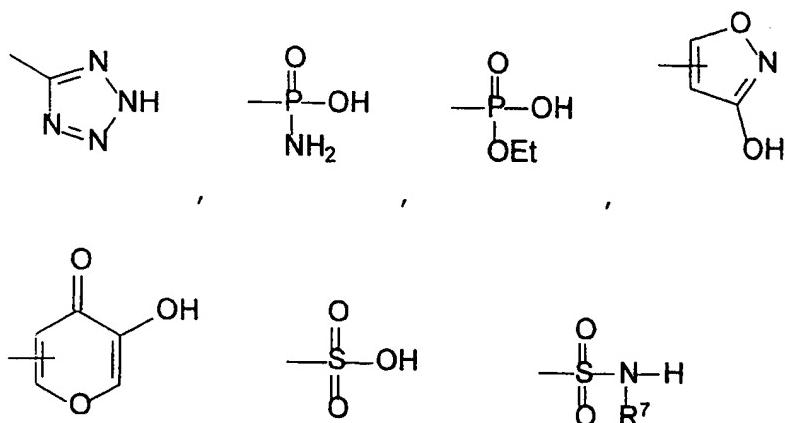

I

10 or a pharmaceutically acceptable salt, hydrate, ester, solvate, prodrug, metabolite, stereoisomer, or mixtures thereof; wherein:

15 Y represents the atoms necessary to form a fused 5- to 6-membered, aromatic or non-aromatic, carbocyclic or N-containing heterocyclic ring, wherein Y and any heteroatom(s) therein are unsubstituted or independently substituted with at least one non-interfering alkyl, alkenyl, cycloalkyl, cycloalkenyl, aralkyl, aryl, carboxy or halo substituent;

20 X is at the 1-position of ring Y and is -COOR₅ or a substituted or unsubstituted moiety selected from the group consisting of

, and , wherein R¹ is

5 hydrogen, alkyl, alkenyl, cycloalkyl or
cycloalkenyl, and is itself either unsubstituted
or substituted with an alkyl, alkenyl,
cycloalkyl or cycloalkenyl group;

10 R₁ is hydrogen, alkyl, alkenyl, cycloalkyl or
cycloalkenyl, and is itself either unsubstituted
or substituted with an alkyl, alkenyl,
cycloalkyl or cycloalkenyl group;

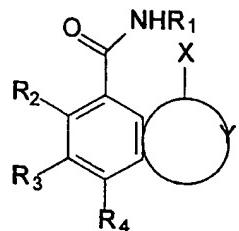

15 R₂, R₃, R₄ and R₅ are independently hydrogen, alkyl,
alkenyl, cycloalkyl, cycloalkenyl, aralkyl,
aryl, amino, hydroxyl, 1-piperazine, 1-
piperidine, or 1-imidazoline, and are either
unsubstituted or substituted with a moiety
selected from the group consisting of alkyl,
alkenyl, alkoxy, phenoxy, benzyloxy, cycloalkyl,
20 cycloalkenyl, hydroxy, carboxy, carbonyl, amino,
amido, cyano, isocyano, nitro, nitroso, nitrilo,
isonitrilo, imino, azo, diazo, sulfonyl,
sulfoxy, thio, thiocarbonyl, sulfhydryl, halo,
haloalkyl, trifluoromethyl, aralkyl and aryl.

25 148. The method of claim 147, wherein when Y is a
fused, 6-membered, aromatic, carbocyclic ring, and R₁, R₂,
R₃, and R₄ are each hydrogen, X is not a -COOH group.

149. The method of claim 147, wherein the compound is

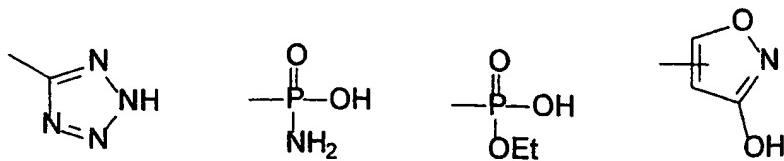

150. A method of radiosensitizing tumor cells in an
5 animal comprising administering to said animal an
effective amount of a compound of formula I:

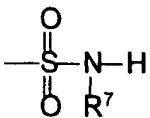

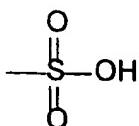

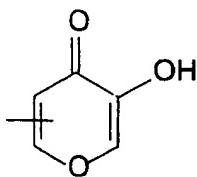

I
or a pharmaceutically acceptable salt, hydrate, ester,
solvate, prodrug, metabolite, stereoisomer, or mixtures
10 thereof; wherein:

Y represents the atoms necessary to form a fused 5-
to 6-membered, aromatic or non-aromatic,
carbocyclic or N-containing heterocyclic ring,
wherein Y and any heteroatom(s) therein are
15 unsubstituted or independently substituted with
at least one non-interfering alkyl, alkenyl,
cycloalkyl, cycloalkenyl, aralkyl, aryl, carboxy
or halo substituent;

X is at the 1-position of ring Y and is -COOR₅ or a
20 substituted or unsubstituted moiety selected
from the group consisting of

, and , wherein R⁷ is

hydrogen, alkyl, alkenyl, cycloalkyl or cyclo-
5 alkenyl, and is itself either unsubstituted or
substituted with an alkyl, alkenyl, cycloalkyl
or cycloalkenyl group;

R₁ is hydrogen, alkyl, alkenyl, cycloalkyl or cyclo-
alkenyl, and is itself either unsubstituted or
substituted with an alkyl, alkenyl, cycloalkyl
10 or cycloalkenyl group;

R₂, R₃, R₄ and R₅ are independently hydrogen, alkyl,
alkenyl, cycloalkyl, cycloalkenyl, aralkyl,
aryl, amino, hydroxyl, 1-piperazine, 1-
15 piperidine, or 1-imidazoline, and are either
unsubstituted or substituted with a moiety
selected from the group consisting of alkyl,
alkenyl, alkoxy, phenoxy, benzyloxy, cycloalkyl,
cycloalkenyl, hydroxy, carboxy, carbonyl, amino,
amido, cyano, isocyano, nitro, nitroso, nitrilo,
20 isonitrilo, imino, azo, diazo, sulfonyl,
sulfoxy, thio, thiocarbonyl, sulfhydryl, halo,
haloalkyl, trifluoromethyl, aralkyl and aryl.

151. The method of claim 150 wherein, when Y is a
25 fused, 6-membered, aromatic carbocyclic ring, and R₁, R₂,
R₃ and R₄ are each hydrogen, X is not a -COOH group.

152. The method of claim 150, wherein the compound is

153. The method of claim 150, wherein the tumor cells
are selected from the group consisting of ACTH-producing
5 tumors, acute lymphocytic leukemia, acute nonlymphocytic
leukemia, cancer of the adrenal cortex, bladder cancer,
brain cancer, breast cancer, cervix cancer, chronic
lymphocytic leukemia, chronic myelocytic leukemia,
colorectal cancer, cutaneous T-cell lymphoma, endometrial
10 cancer, esophageal cancer, Ewing's sarcoma, gallbladder
cancer, hairy cell leukemia, head & neck cancer, Hodgkin's
lymphoma, Kaposi's sarcoma, kidney cancer, liver cancer,
lung cancer (small and/or non-small cell), malignant
peritoneal effusion, malignant pleural effusion, melanoma,
15 mesothelioma, multiple myeloma, neuroblastoma, non-
Hodgkin's lymphoma, osteosarcoma, ovary cancer, ovary
(germ cell) cancer, prostate cancer, pancreatic cancer,
penis cancer, retinoblastoma, skin cancer, soft-tissue
sarcoma, squamous cell carcinomas, stomach cancer,
20 testicular cancer, thyroid cancer, trophoblastic
neoplasms, cancer of the uterus, vaginal cancer, cancer of
the vulva and Wilm's tumor.

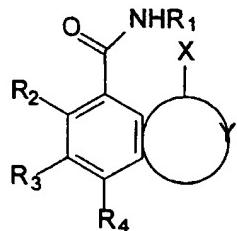

154. The method of claim 150, wherein said
25 pharmaceutical composition is in a carrier comprising a
biodegradable polymer.

155. The method of claim 154, wherein the
biodegradable polymer carrier is in the form of a solid
30 implant.

156. The method of claim 154, wherein the

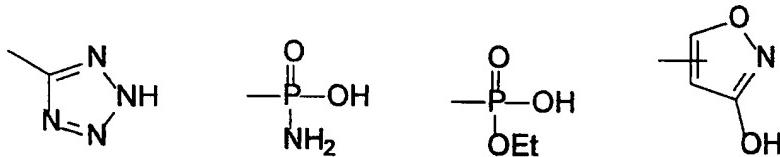

biodegradable polymer releases the compound of formula I over a prolonged period of time.

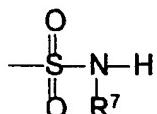

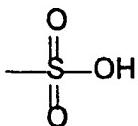

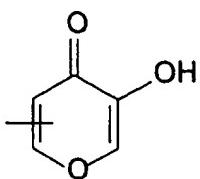

157. A method to extend the lifespan and
 5 proliferative capacity of cells in an animal comprising
 administering to said animal an effective amount of a
 compound of formula I:

I
 or a pharmaceutically acceptable salt, hydrate, ester,
 10 solvate, prodrug, metabolite, stereoisomer, or mixtures
 thereof; wherein:

- Y represents the atoms necessary to form a fused 5-
 to 6-membered, aromatic or non-aromatic,
 carbocyclic or N-containing heterocyclic ring,
 15 wherein Y and any heteroatom(s) therein are
 unsubstituted or independently substituted with
 at least one non-interfering alkyl, alkenyl,
 cycloalkyl, cycloalkenyl, aralkyl, aryl, carboxy
 or halo substituent;
- 20 X is at the 1-position of ring Y and is -COOR₅ or a
 substituted or unsubstituted moiety selected
 from the group consisting of

, and , wherein R⁷ is

hydrogen, alkyl, alkenyl, cycloalkyl or cycloalkenyl, and is itself either unsubstituted or substituted with an alkyl, alkenyl, cycloalkyl or cycloalkenyl group;

5

R₁ is hydrogen, alkyl, alkenyl, cycloalkyl or cycloalkenyl, and is itself either unsubstituted or substituted with an alkyl, alkenyl, cycloalkyl or cycloalkenyl group;

10

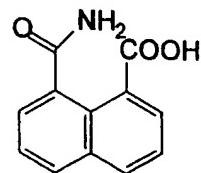

R₂, R₃, R₄ and R₅ are independently hydrogen, alkyl, alkenyl, cycloalkyl, cycloalkenyl, aralkyl, aryl, amino, hydroxyl, 1-piperazine, 1-piperidine, or 1-imidazoline, and are either unsubstituted or substituted with a moiety selected from the group consisting of alkyl, alkenyl, alkoxy, phenoxy, benzyloxy, cycloalkyl, cycloalkenyl, hydroxy, carboxy, carbonyl, amino, amido, cyano, isocyano, nitro, nitroso, nitrilo, isonitrilo, imino, azo, diazo, sulfonyl, sulfoxy, thio, thiocarbonyl, sulfhydryl, halo, haloalkyl, trifluoromethyl, aralkyl and aryl.

15

20

158. The method of claim 157 wherein, when Y is a fused, 6-membered, aromatic carbocyclic ring, and R₁, R₂, R₃ and R₄ are each hydrogen, X is not a -COOH group.

159. The method of claim 157, wherein the compound is

160. The method of claim 157, wherein said method is used to treat a disease or disease conditions induced or 5 exacerbated by cellular senescence.

161. The method of claim 160, wherein said disease is a disease selected from the group consisting of skin aging, Alzheimer's disease, atherosclerosis, 10 osteoarthritis, osteoporosis, muscular dystrophy, age-related macular degeneration, immune senescence, and AIDS.

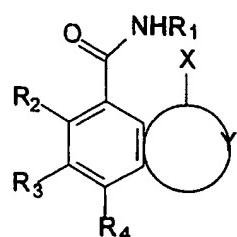

162. The method of claim 157, wherein said pharmaceutical composition is in a carrier comprising a 15 biodegradable polymer.

163. The method of claim 162, wherein the biodegradable polymer carrier is in the form of a solid implant.

20

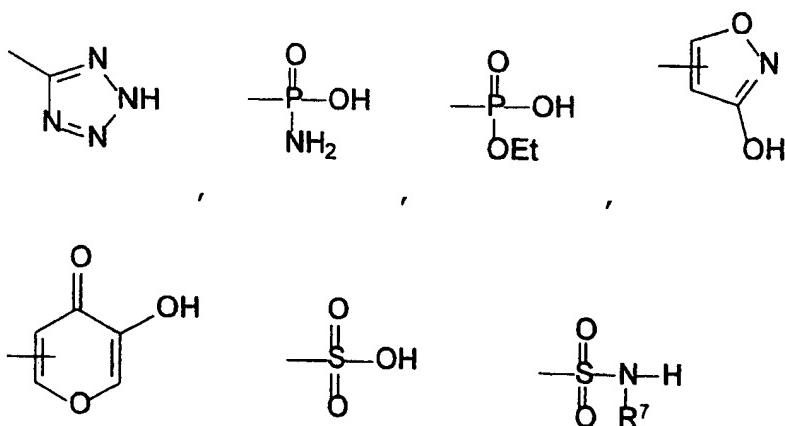

164. The method of claim 162, wherein the biodegradable polymer releases the compound of formula I over a prolonged period of time.

25 165. A method of altering gene expression of senescent cells comprising administering a compound of formula I:

or a pharmaceutically acceptable salt, hydrate, ester, solvate, prodrug, metabolite, stereoisomer, or mixtures thereof; wherein:

- 5 Y represents the atoms necessary to form a fused 5- to 6-membered, aromatic or non-aromatic, carbocyclic or N-containing heterocyclic ring, wherein Y and any heteroatom(s) therein are unsubstituted or independently substituted with
- 10 at least one non-interfering alkyl, alkenyl, cycloalkyl, cycloalkenyl, aralkyl, aryl, carboxy or halo substituent;
- 15 X is at the 1-position of ring Y and is -COOR₅ or a substituted or unsubstituted moiety selected from the group consisting of

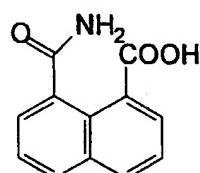

- and , wherein R⁷ is
hydrogen, alkyl, alkenyl, cycloalkyl or cycloalkenyl, and is itself either unsubstituted or substituted with an alkyl, alkenyl, cycloalkyl or cycloalkenyl group;

R₁ is hydrogen, alkyl, alkenyl, cycloalkyl or cyclo-alkenyl, and is itself either unsubstituted or substituted with an alkyl, alkenyl, cycloalkyl or cycloalkenyl group;

5 R₂, R₃, R₄ and R₅ are independently hydrogen, alkyl, alkenyl, cycloalkyl, cycloalkenyl, aralkyl, aryl, amino, hydroxyl, 1-piperazine, 1-piperidine, or 1-imidazoline, and are either unsubstituted or substituted with a moiety
10 selected from the group consisting of alkyl, alkenyl, alkoxy, phenoxy, benzyloxy, cycloalkyl, cycloalkenyl, hydroxy, carboxy, carbonyl, amino, amido, cyano, isocyano, nitro, nitroso, nitrilo, isonitrilo, imino, azo, diazo, sulfonyl,
15 sulfoxy, thio, thiocarbonyl, sulfhydryl, halo, haloalkyl, trifluoromethyl, aralkyl and aryl.

166. The method of claim 165 wherein, when Y is a fused, 6-membered, aromatic carbocyclic ring, and R₁, R₂,
20 R₃ and R₄ are each hydrogen, X is not a -COOH group.

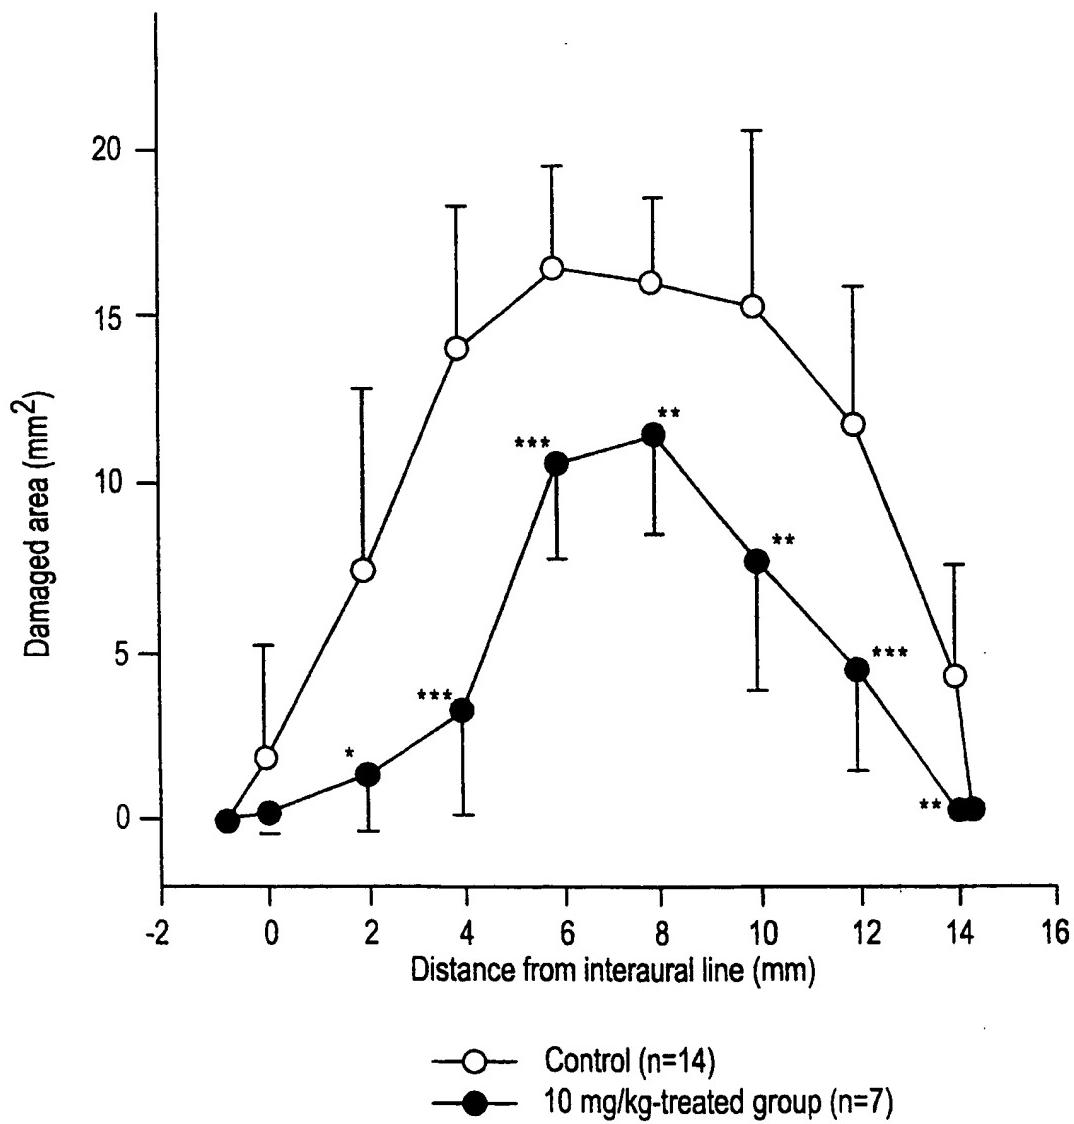

167. The method of claim 165, wherein the compound is

168. The compounds, compositions, methods and
25 processes described herein.
